

# Revolutionizing Vertical Farming: Tower Garden Commander

# The Team

**Rachel Ha**  
Electrical Lead

**Viraj Pahwa**  
Project Manager

**Ben Starkey**  
Deliverable Lead

**Kyle Ralyea**  
Design Lead

**Siddarth Singh**  
Software Lead

**Brody Oliver**  
Technical Lead

# Agenda

1. Project Overview & Progress Recap
2. Electrical Update
3. Mechanical Update
4. Software Update
5. Final Steps

Tower Garden

# Project Overview

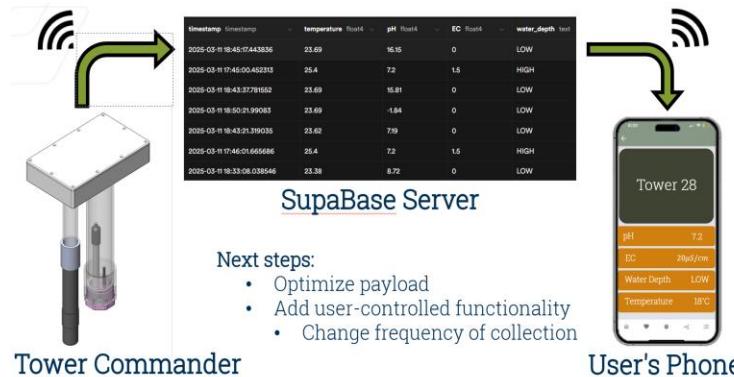

## Goal:

To develop a smart sensing device  
that measures water health in Tower  
Gardens

**How we measure water health:**  
pH, EC, Temperature, and Depth

# Where We Left Off in Week 10

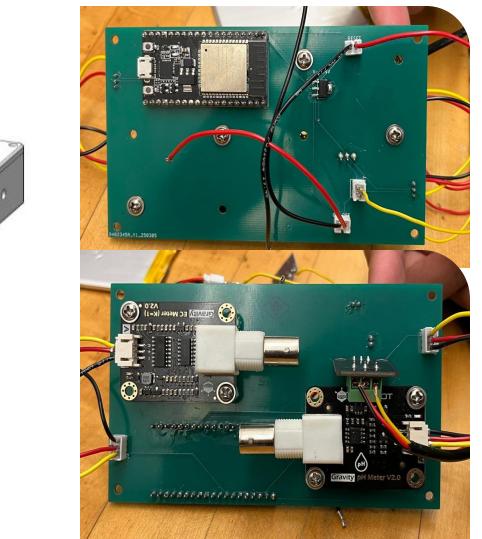

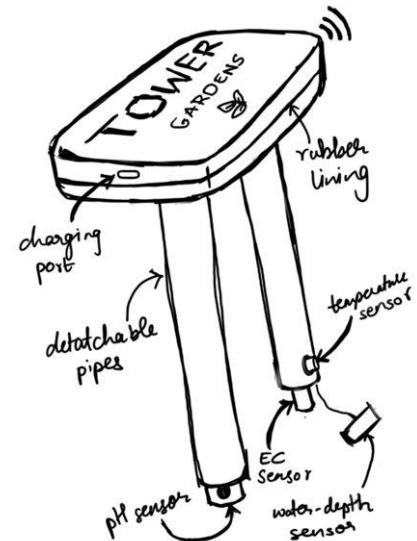

- Design Concept Selection
- Sensor Selection
- Proof-of-Concept PCB Design
- Preliminary Communication Software
- Battery Life Optimization & Charging
- Initial Packaging Design

## Battery Life

### Planned Optimizations:

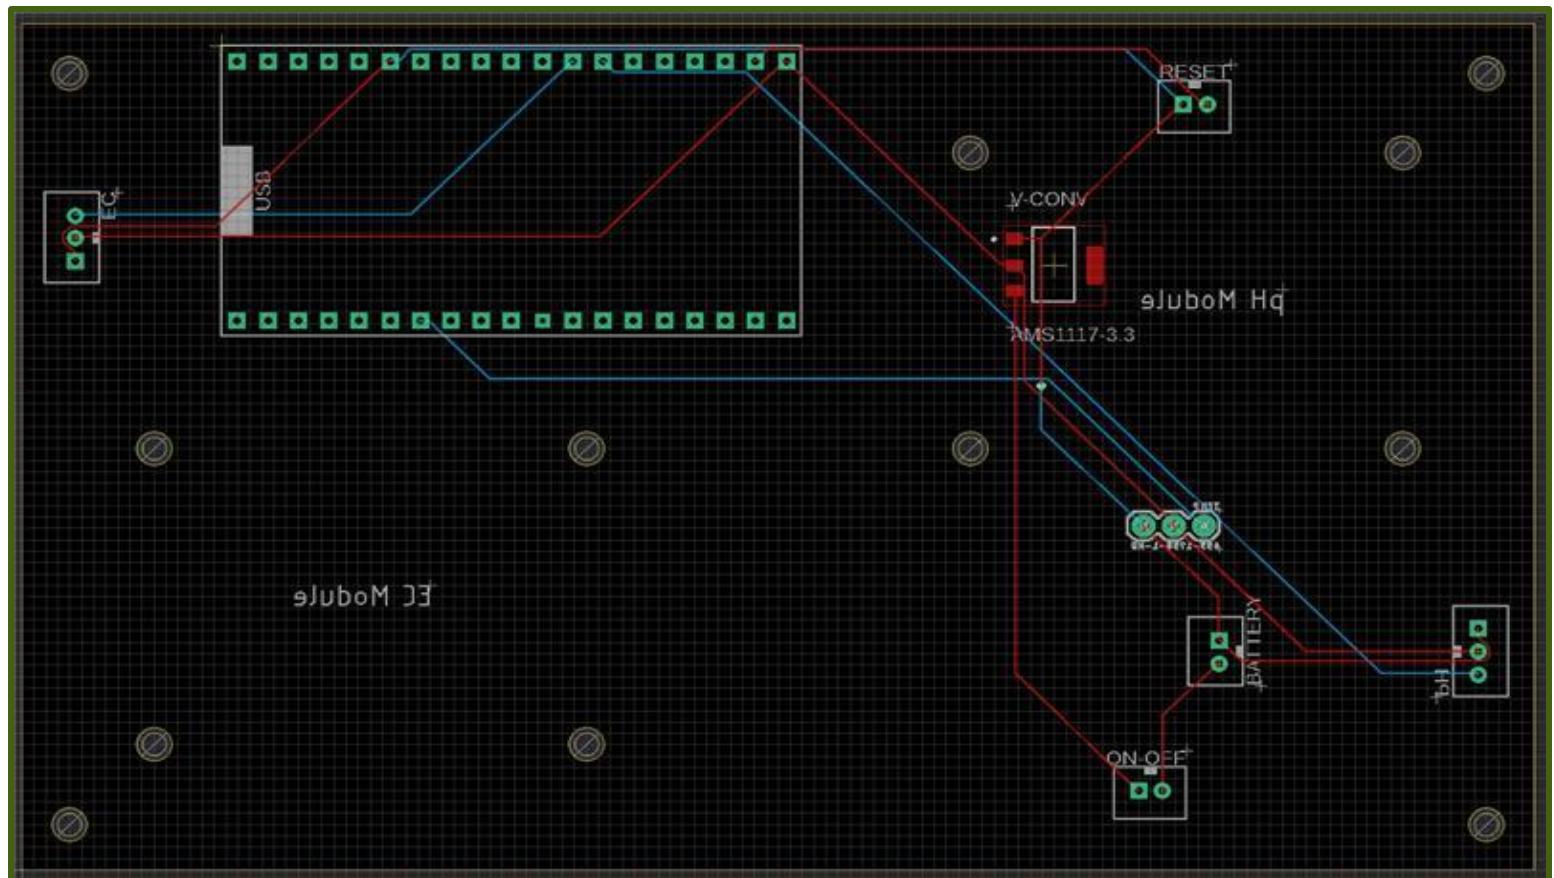

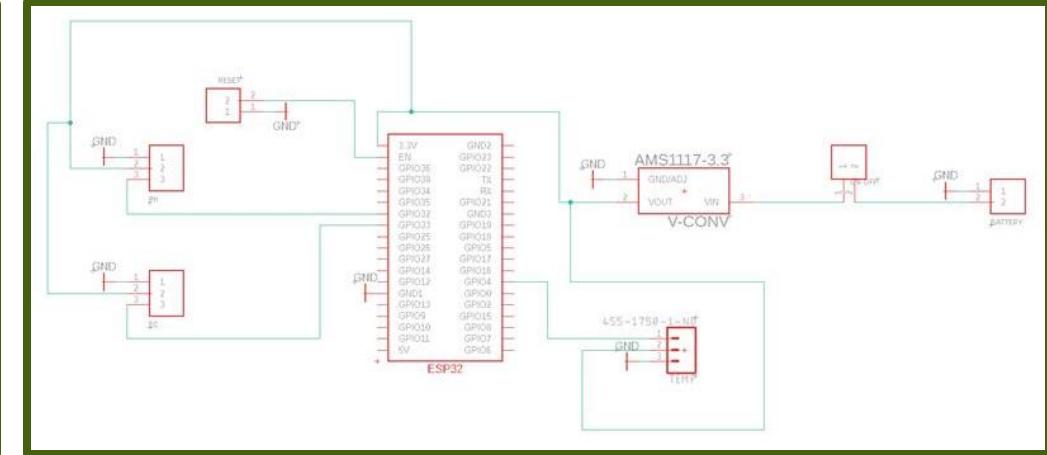

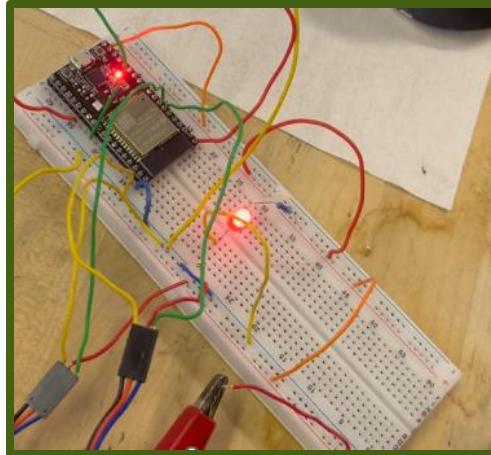

- Using deep sleep (0.1 mA) & turning off sensors in downtime (in hardware)
  - $(150\text{mA} * 0.2\text{hr}) + (0.1\text{mA} * 23.8\text{hr}) = 32 \text{ mAh}$
  - **93 days battery life**
  - Downside: no real-time capture
- Replacing the ESP32
  - Low-power WiFi module
  - Downside: low-level programming
- Software
  - Reducing dependency on libraries -> lower memory

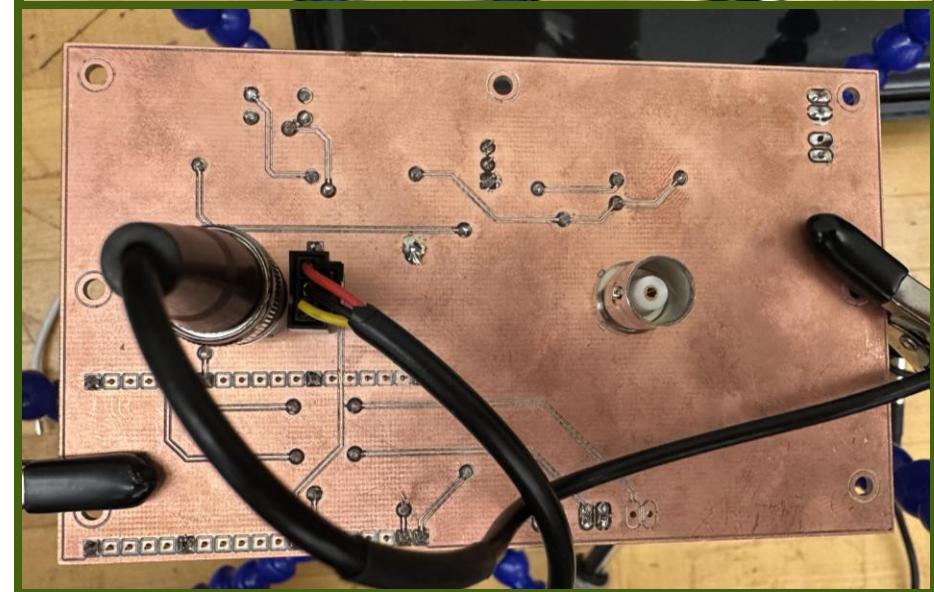

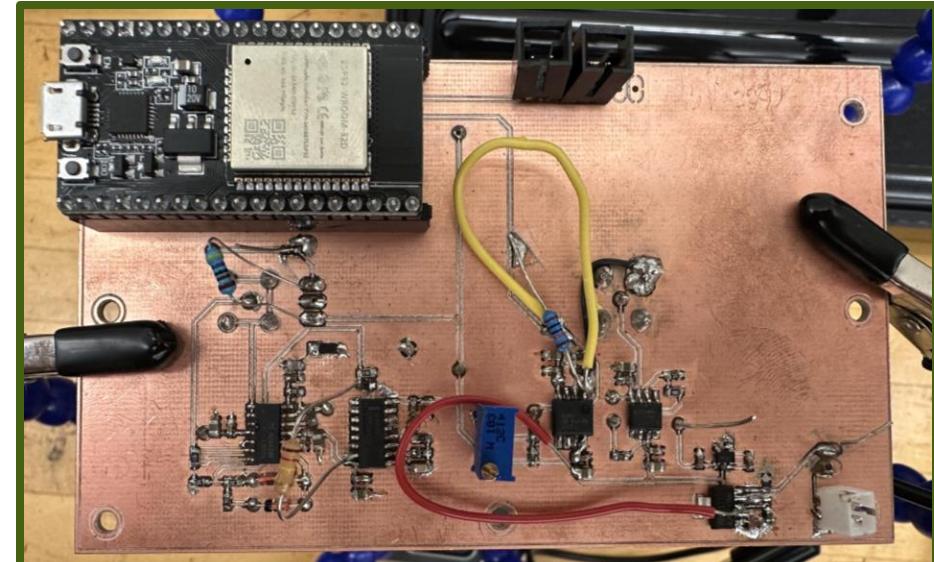

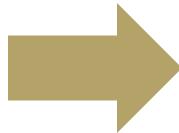

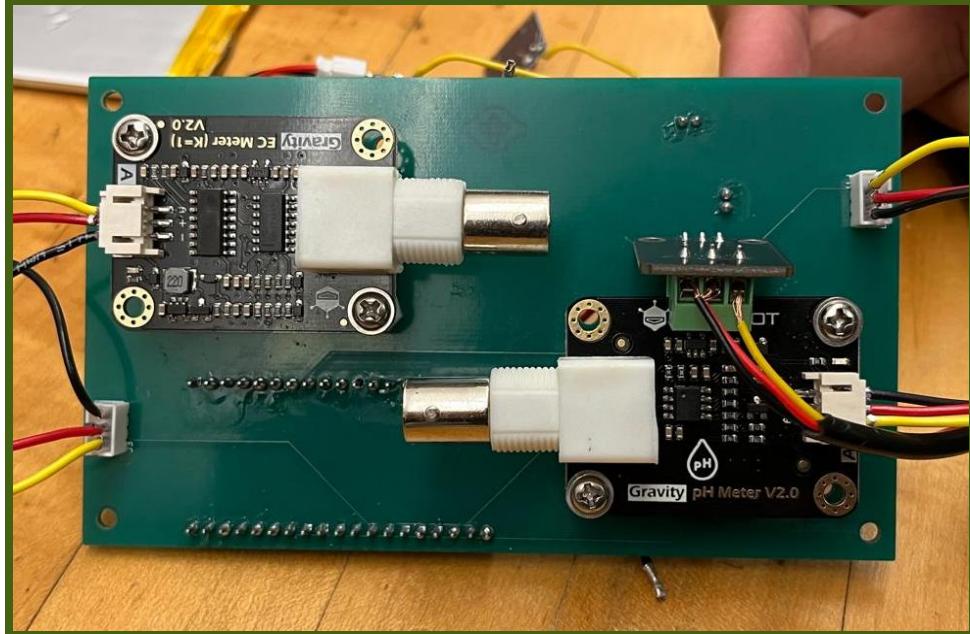

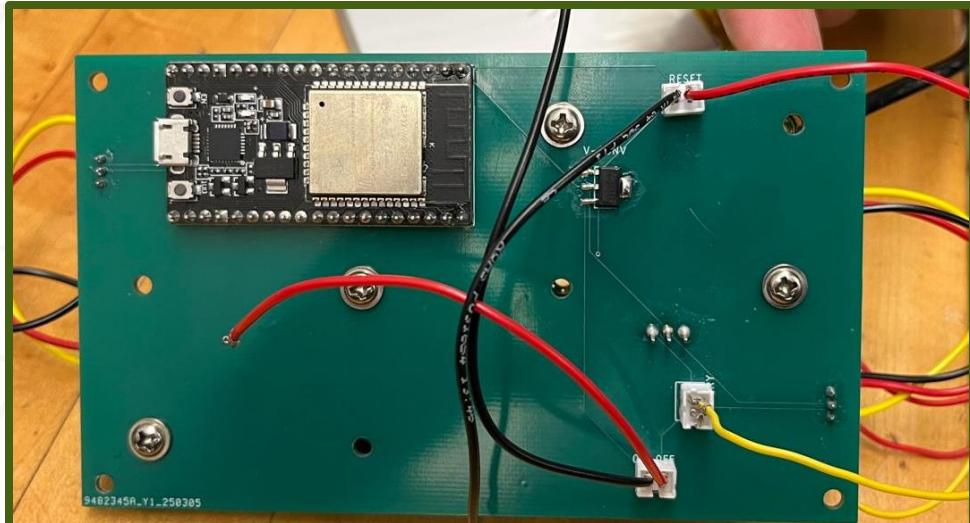

# Electrical Development

# Where We Left Off

- Proof-of-Concept PCB design
  - Utilized sensor modules
  - Battery Life
  - Error Found:  
Not properly soldering component connecting power

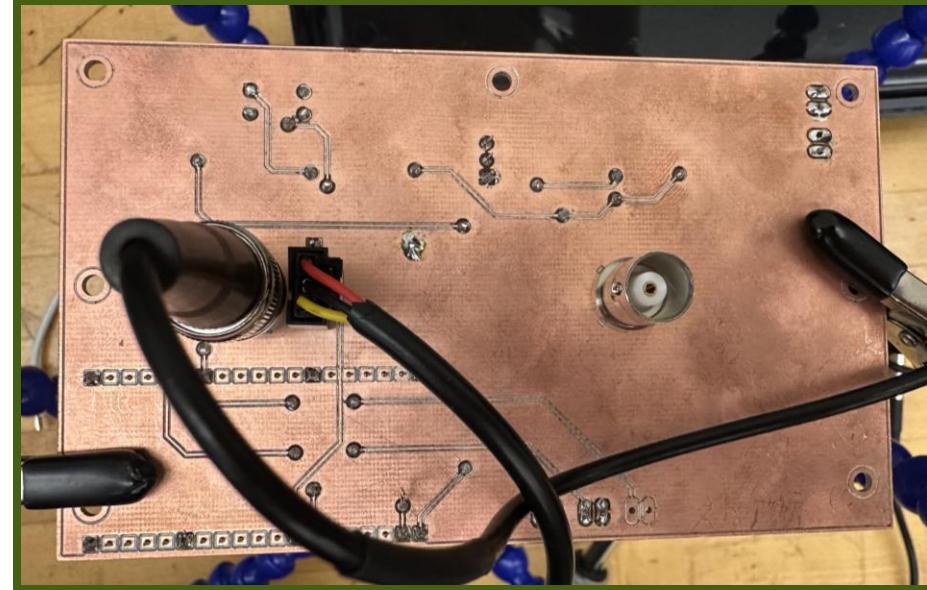

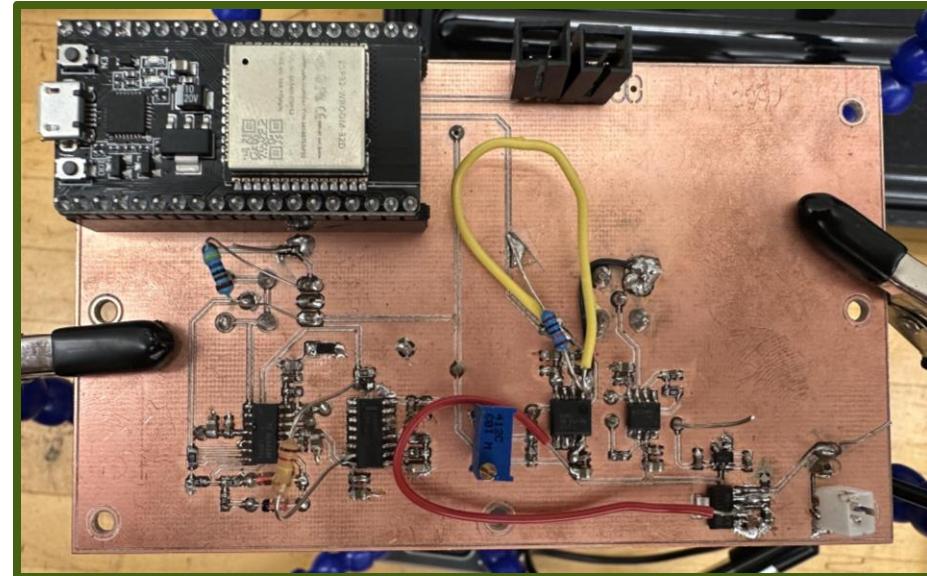

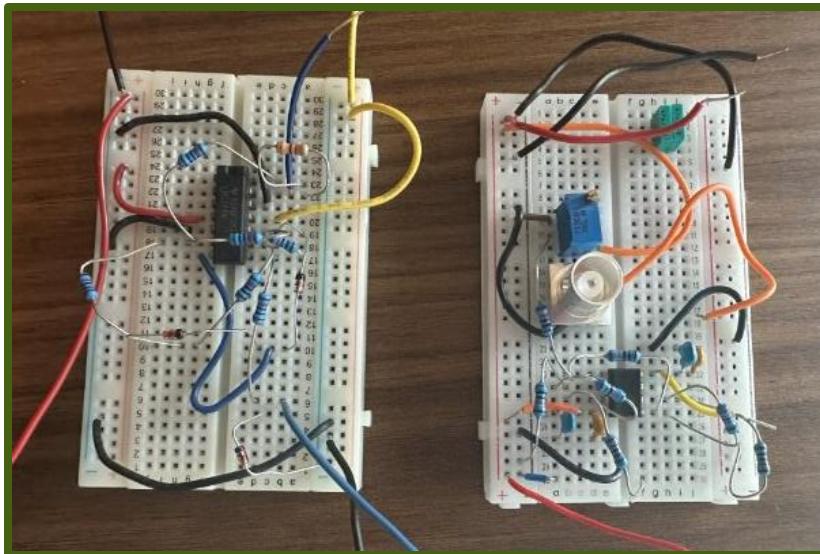

# What Did We Change

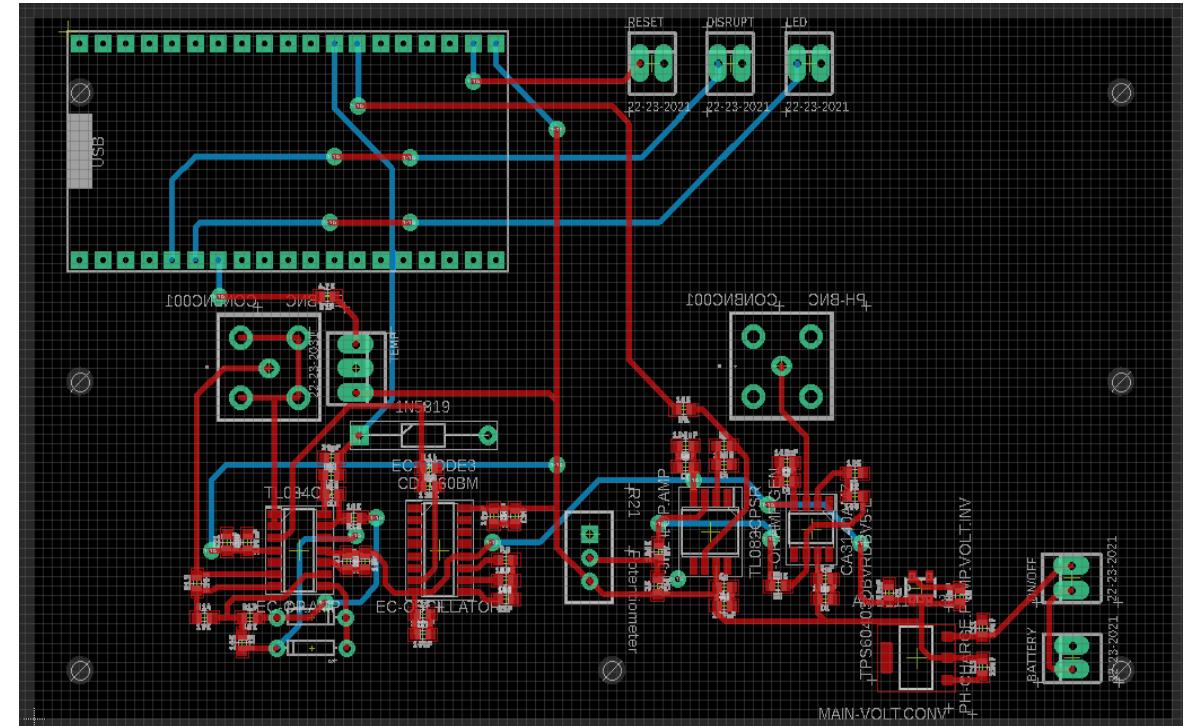

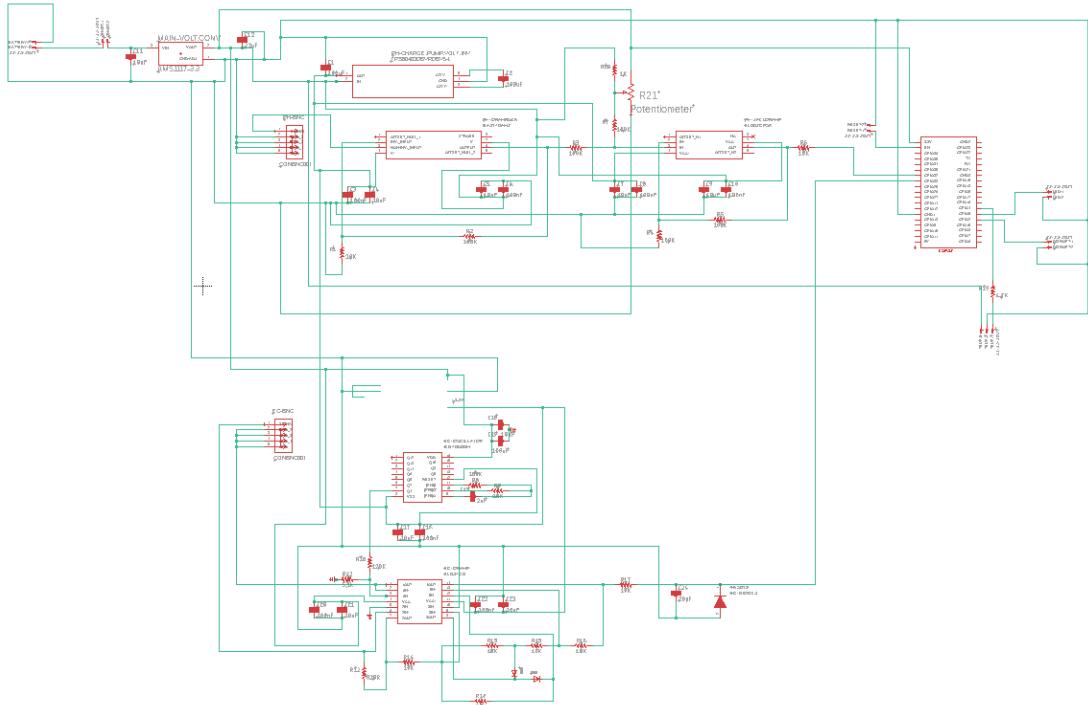

# What Did We Change

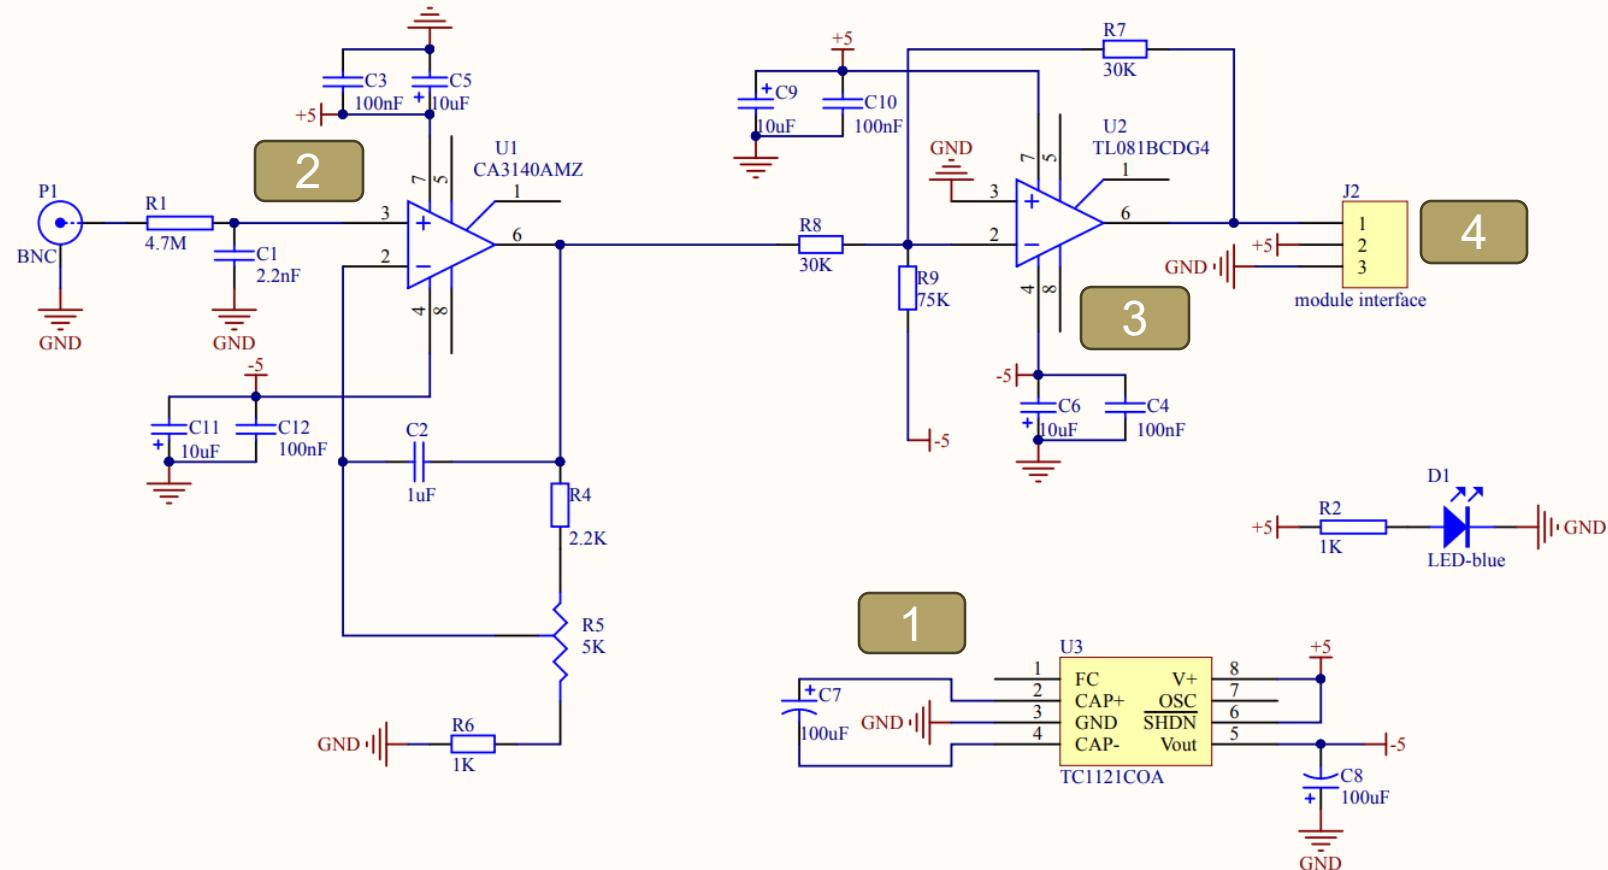

- Reverse engineer each sensor modules → Embed all components onto a single, central PCB
- Design an integrated charging circuit for enclosed, external battery charging

# v2 PCB Design

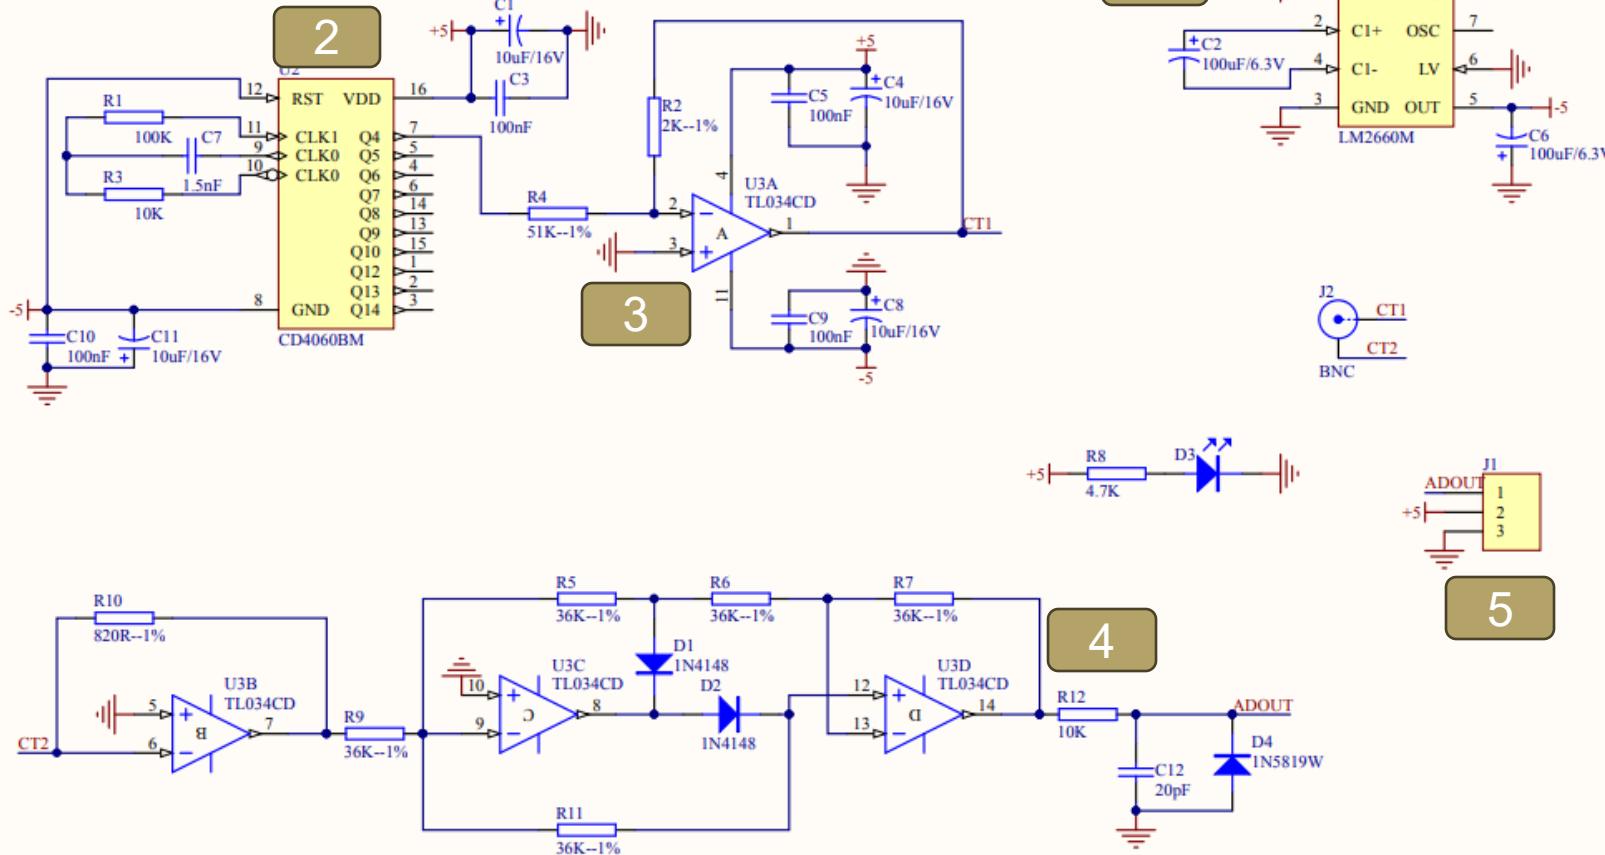

# pH Sensor

## Key Points:

- 1) Negative Supply
- 2) Op Amp
- 3) JFET Amplifier
- 4) Output Voltage

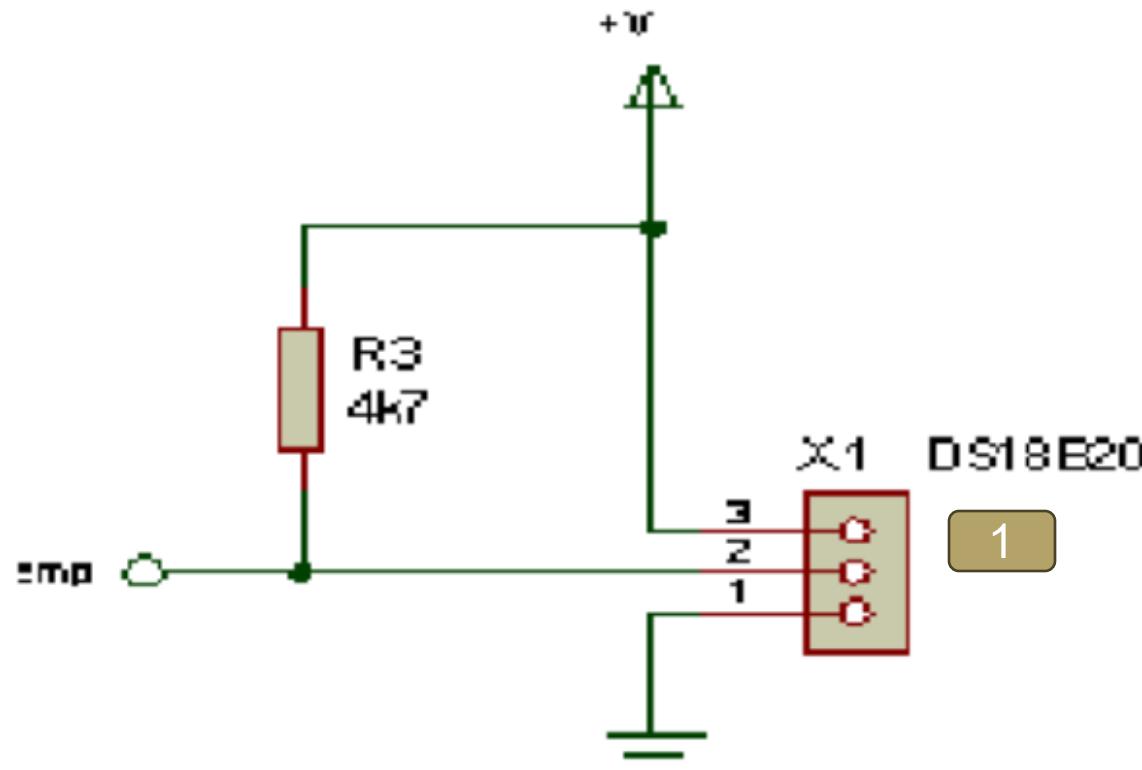

# EC Sensor

## Key Points:

- 1) Negative Supply
- 2) Oscillator
- 3) JFET Amplifier (Signal)
- 4) JFET Amplifier (GND)
- 5) Output Voltage

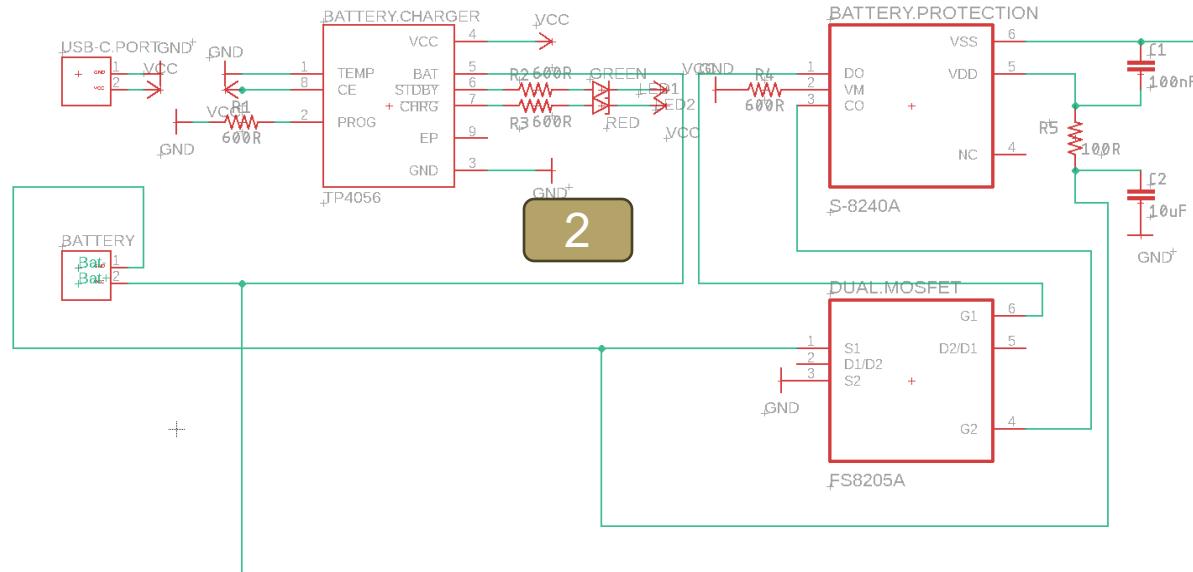

# Temperature Sensor

## Key Points:

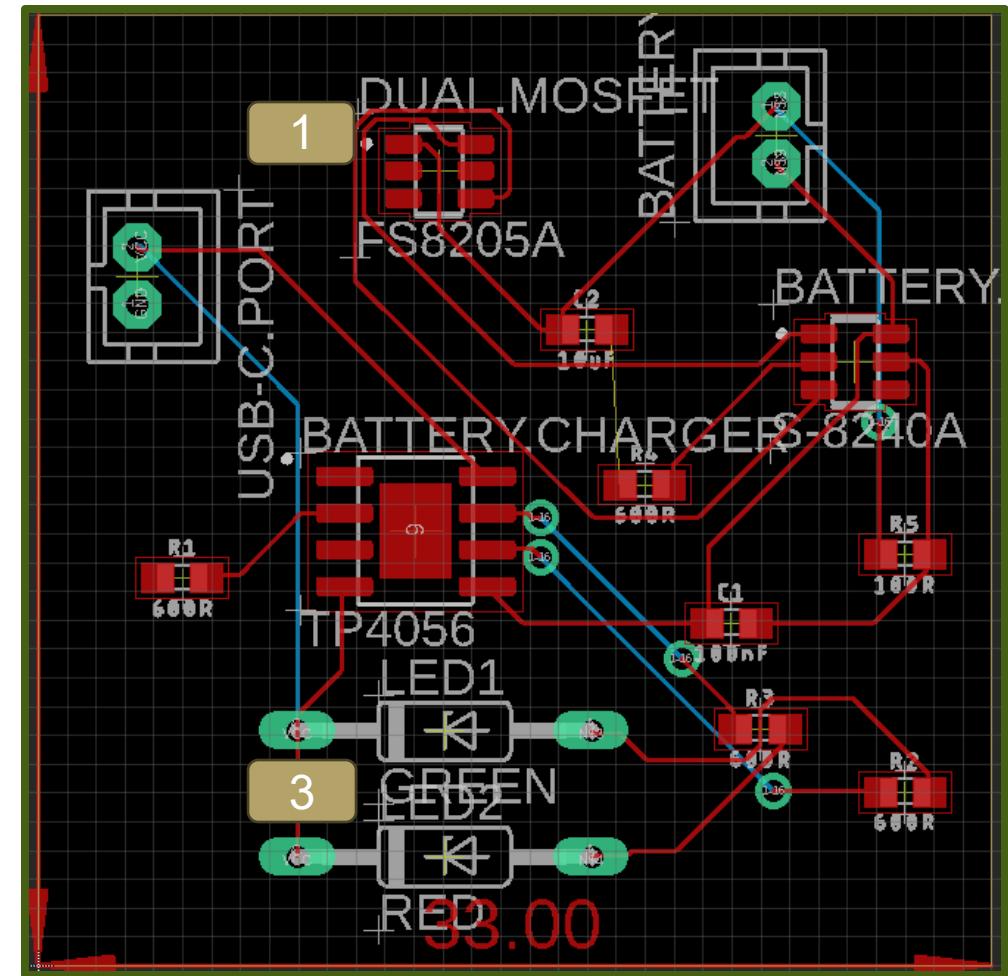

- 1) Output Temperature

# Battery Charging

## Key Points:

- 1) USB-C
  - 2) Battery Charging and Protection
  - 3) Charging LEDs

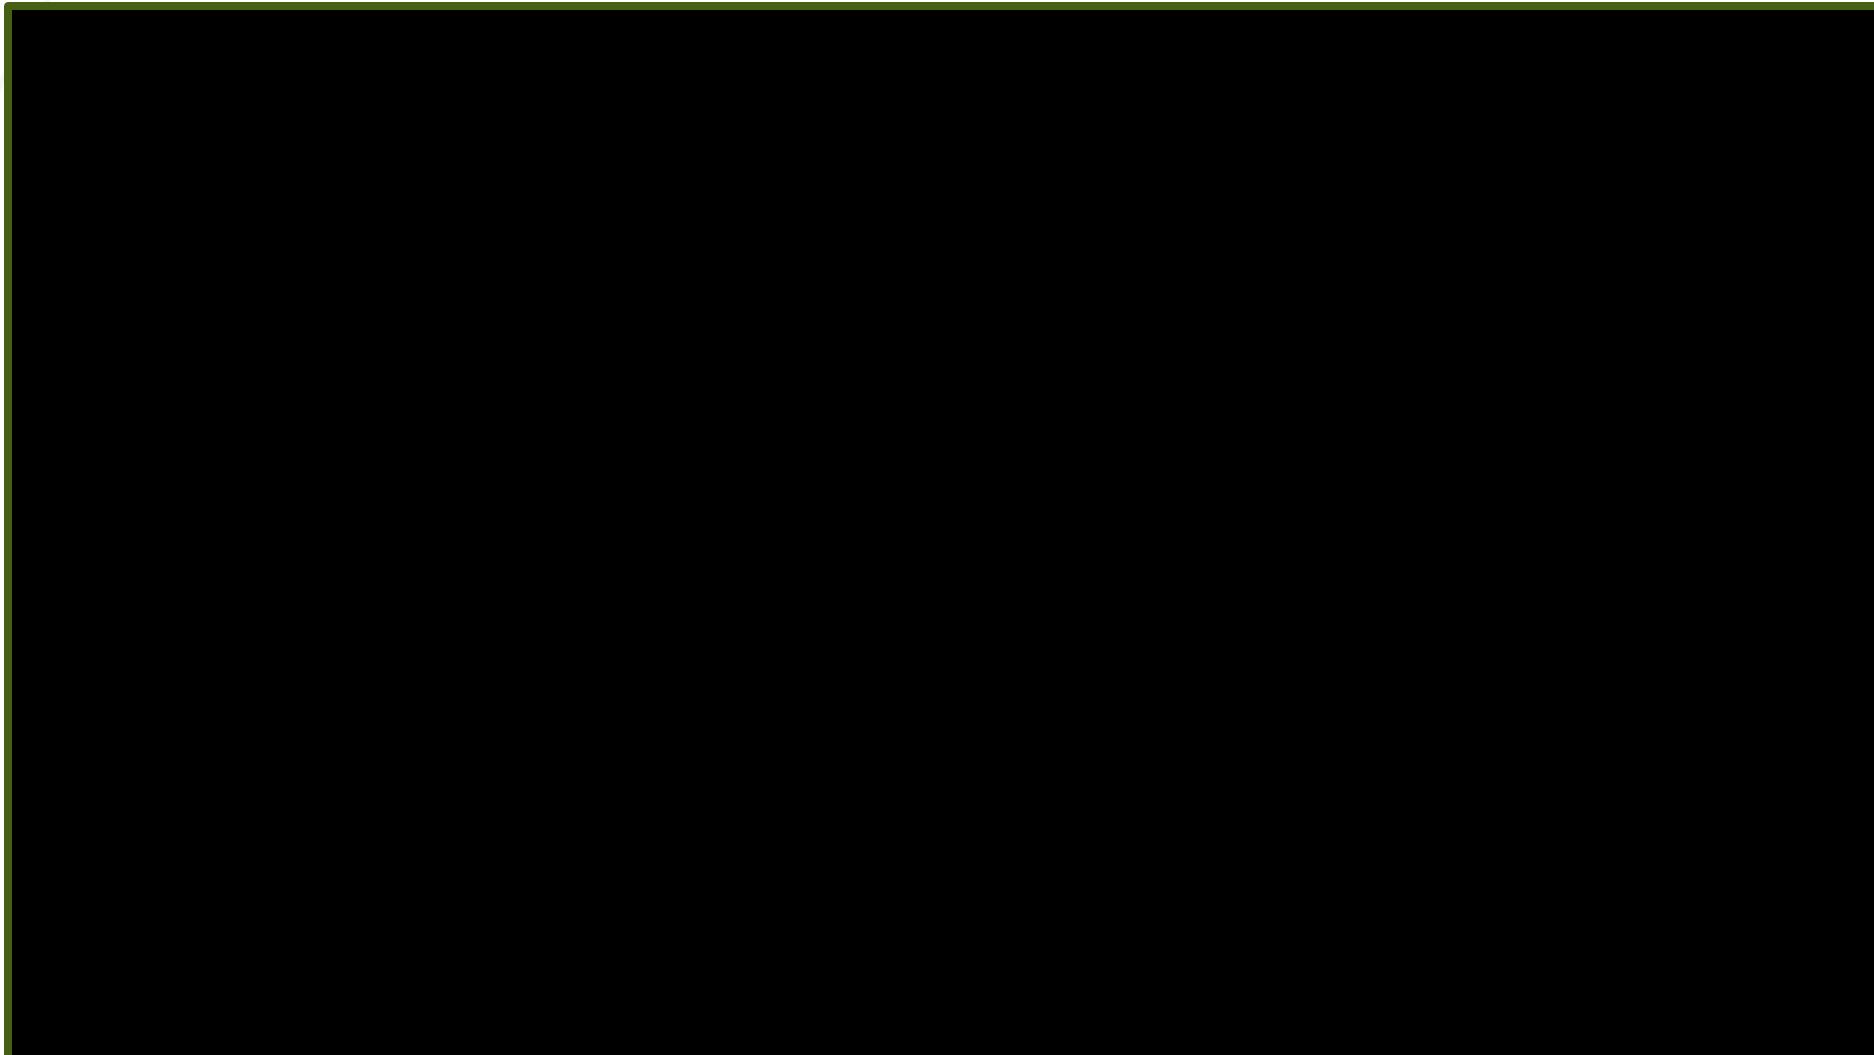

# Additional Components

- **On/Off Switch:** Toggle power
- **Reset Button:** Reset device
- **Disrupt/Calibration Button:**
  - 1 push: Disrupt – Takes readings at un-predetermined times
  - 2 push: Calibration – Lower Value
  - 3 push: Calibration – Higher Value
- **LED:** Status Indication
  - Flash 3x Green: Turning on
  - Flash 3x Red: Turning off
  - Flash Continuous Yellow: Currently reading sensors
  - Permanent Red: Something wrong with sensors
  - Permanent Yellow: Need to charge battery
  - Permanent Blue: Need to recalibrate sensor

# PCB Demo Video

# Example Readings (PCB)

```
Temperature: 25.12 °C | pH Voltage: Error | EC Voltage: 1.22 V
Temperature: 25.12 °C | pH Voltage: Error | EC Voltage: 0.15 V
Temperature: 25.12 °C | pH Voltage: Error | EC Voltage: 1.23 V
Temperature: 25.12 °C | pH Voltage: Error | EC Voltage: 1.22 V
Temperature: 25.12 °C | pH Voltage: Error | EC Voltage: 1.21 V
Temperature: 25.12 °C | pH Voltage: Error | EC Voltage: 1.23 V
Temperature: 25.12 °C | pH Voltage: Error | EC Voltage: 1.22 V
Temperature: 25.12 °C | pH Voltage: Error | EC Voltage: 1.20 V
Temperature: 25.12 °C | pH Voltage: Error | EC Voltage: 1.24 V
Temperature: 25.12 °C | pH Voltage: Error | EC Voltage: 1.22 V
Temperature: 25.19 °C | pH Voltage: Error | EC Voltage: 1.20 V
Temperature: 25.12 °C | pH Voltage: Error | EC Voltage: 1.22 V
Temperature: 25.12 °C | pH Voltage: Error | EC Voltage: 1.22 V
```

```
Temperature: 28.56 °C | pH Voltage: Error | EC Voltage: 0.03 V
Temperature: 28.62 °C | pH Voltage: Error | EC Voltage: 0.03 V
Temperature: 28.75 °C | pH Voltage: Error | EC Voltage: 0.04 V
Temperature: 28.81 °C | pH Voltage: Error | EC Voltage: 0.03 V
Temperature: 28.87 °C | pH Voltage: Error | EC Voltage: 0.02 V
Temperature: 28.94 °C | pH Voltage: Error | EC Voltage: 0.03 V
Temperature: 29.00 °C | pH Voltage: Error | EC Voltage: 0.00 V
Temperature: 29.06 °C | pH Voltage: Error | EC Voltage: 0.03 V
Temperature: 29.19 °C | pH Voltage: Error | EC Voltage: 0.03 V
Temperature: 29.19 °C | pH Voltage: Error | EC Voltage: 0.03 V
Temperature: 29.25 °C | pH Voltage: Error | EC Voltage: 0.03 V
Temperature: 29.31 °C | pH Voltage: Error | EC Voltage: 0.03 V
```

- Lower Temp
- 12.88 mS/cm

- Higher Temp
- 1430 uS/cm

# Next Steps - Electrical

- Continue troubleshooting and debugging PCB pertaining to pH sensor
- V&V testing
- Manufacturing:
  - Embed charging circuit onto main PCB
  - Edge testing with power supply
  - Alter schematic to embed ESP32 chip

# Packaging Development

# Where We Left Off

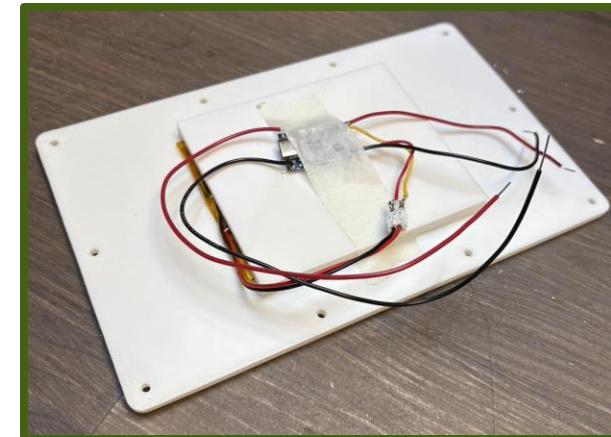

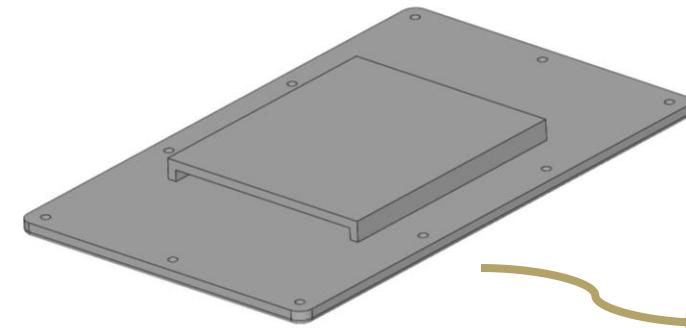

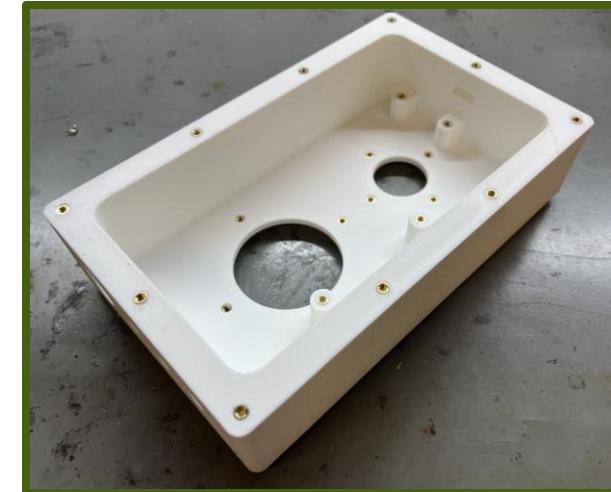

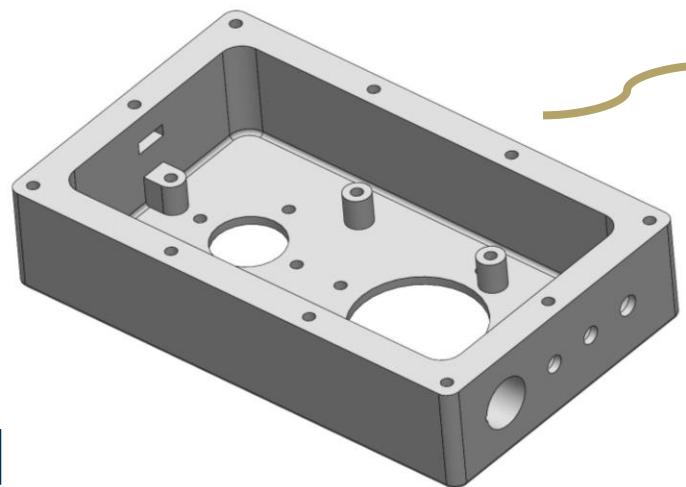

## Prototype Design

- PLA 3D printed enclosure and lid
- PVC pipes to hold sensors
- ABS 3D-printed pipe attachments
- Tolerancing issues with threaded inserts and pipe attachments
- Missing details for parts interfacing

# Packaging – Enclosure

## Improvements

- Standoffs for PCB added, placing BNC connectors above respective tubes
- Sleeve for battery added on lid
- USB-C charging port and LED added
- Heat-set insert tolerancing issue fixed

# Sealing

## Improvements

- ABS pipe attachment tolerancing issue fixed, ABS-PVC pipe cement implemented
- Gaskets implemented

## Testing for IPX8 Standards

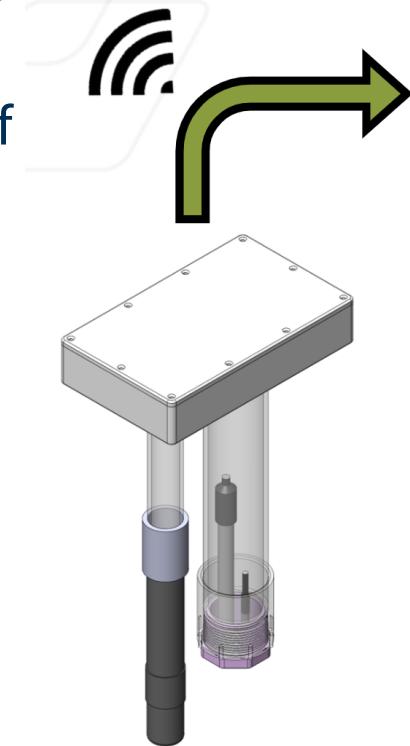

- Joints on pipes – Waterproof
- pH sensor connection – Waterproof
- Temp sensor connection – Waterproof
- ***EC sensor connection – Not Waterproof***
  - *New grommet for EC sensor to be implemented*

# Software Development

# Where We Left Off

- Backend data setup
- Problems:
  - Constant running of ESP drains power
  - Requires manual updating of software
  - No structure in database

timestamp	temperature	pH	EC	water_depth
float4	float4	float4	float4	text

SupaBase Server

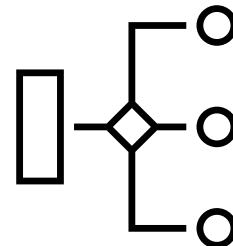

User's Phone

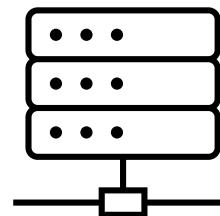

## Next steps:

- Optimize payload
- Add user-controlled functionality
- Change frequency of collection

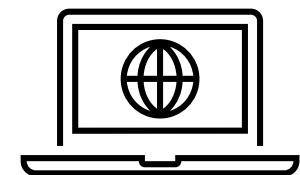

"free, open-source workflow automation tool that uses a node-based approach"

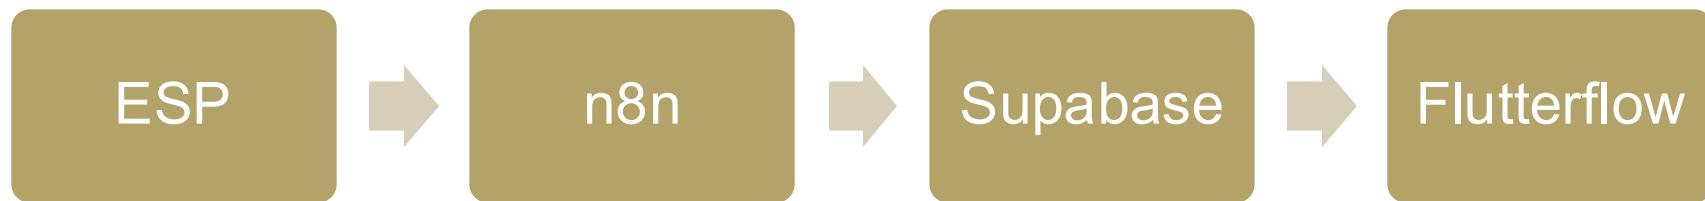

Systematic  
Data-flow

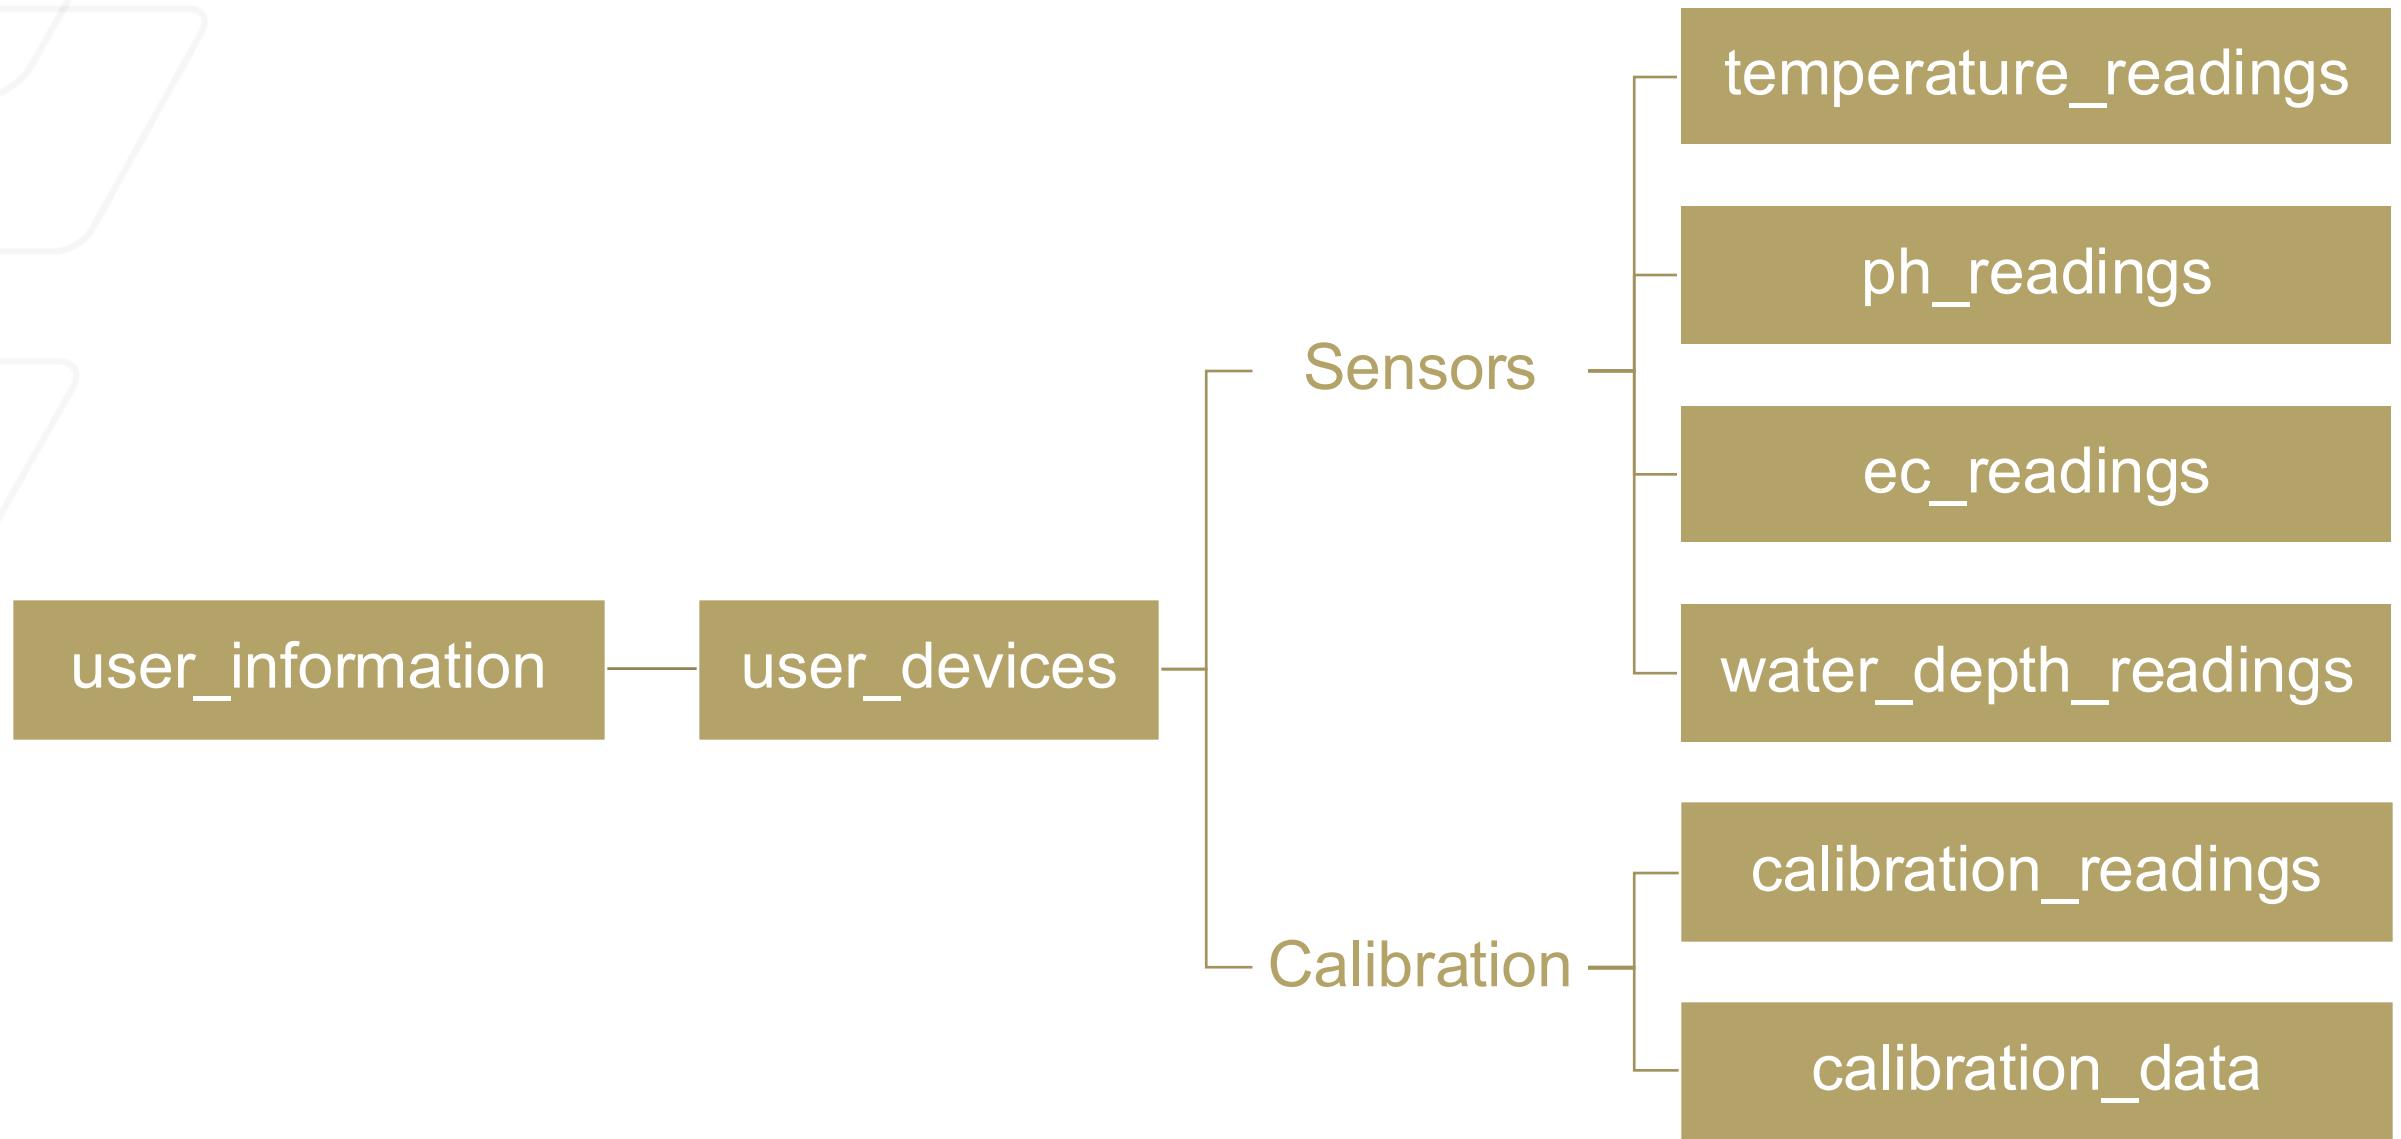

Remote Data  
Processing

Software Update  
Capability

# Data Transfer

# Data Transfer

# Calibration

- Why do we need to calibrate?
  - Sensors inevitably drift and deviate from their intended performance due to various factors, leading to inaccurate readings
    - Length of Operation (Natural Degradation)
    - Temperature Fluctuations
    - Humidity-induced Corrosion
    - Debris Contamination
- How to calibrate:
  - Read output voltage from a known "low pH/EC" solution
  - Read output voltage from a known "high pH/EC" solution
  - Create a linear relationship that transforms the sensor reading to the expected measurement
    - $y = mx + b$ :
      - m: slope of the voltage & pH/EC relationship
      - b: intercept of the voltage & pH/EC relationship
  - Now, every voltage reading is correlated to its proper value reading

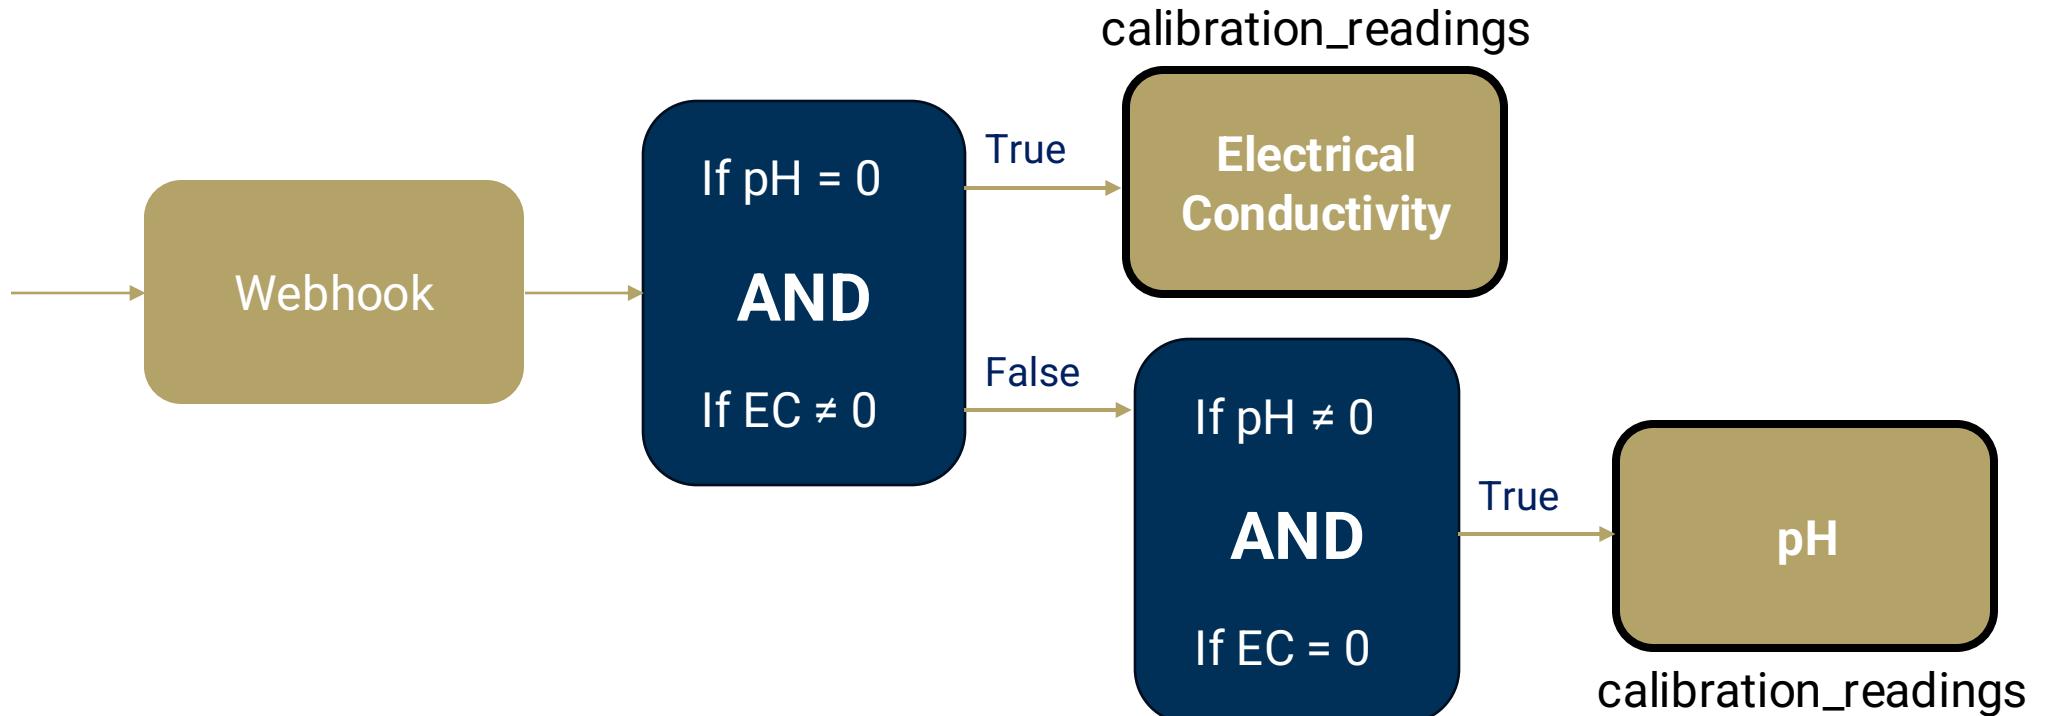

# Calibration - Lower Value

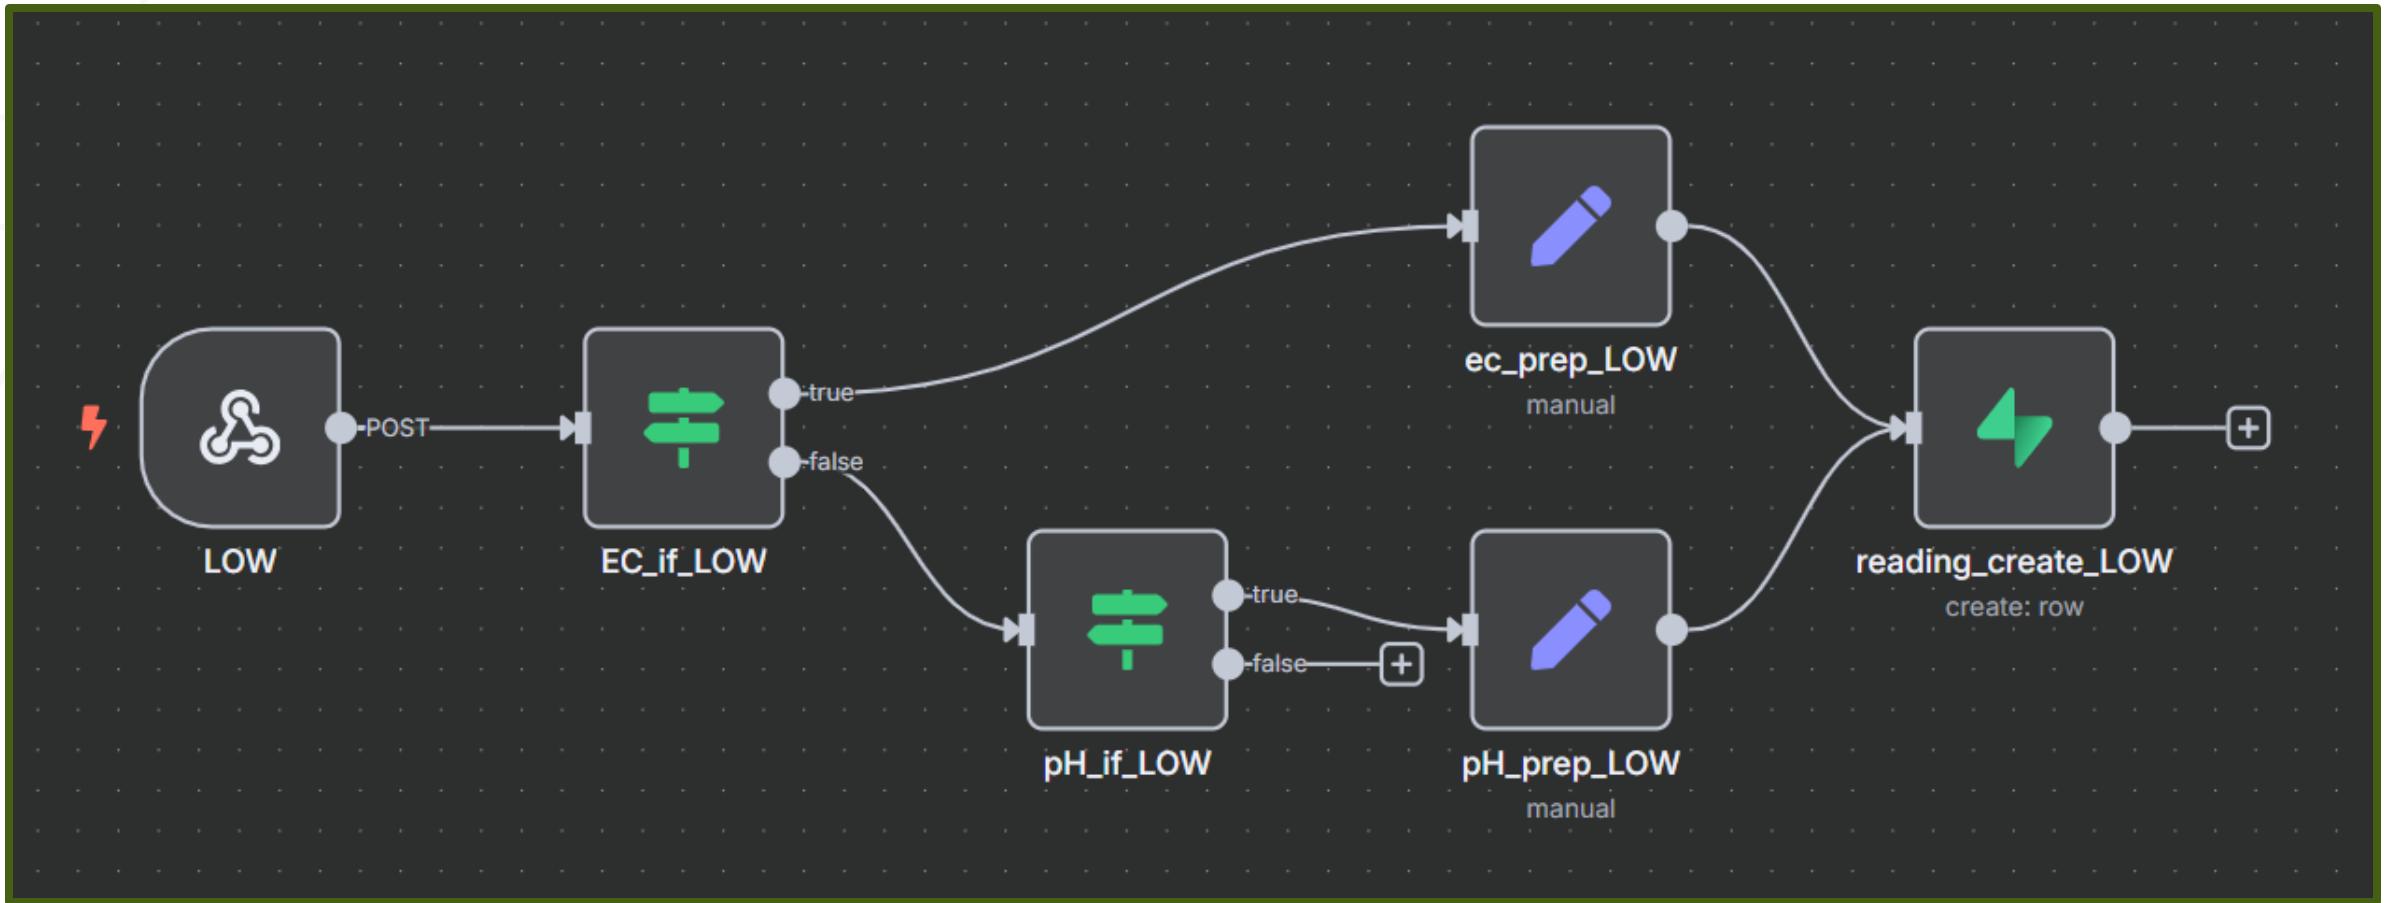

2x

Press button  
twice on the  
device

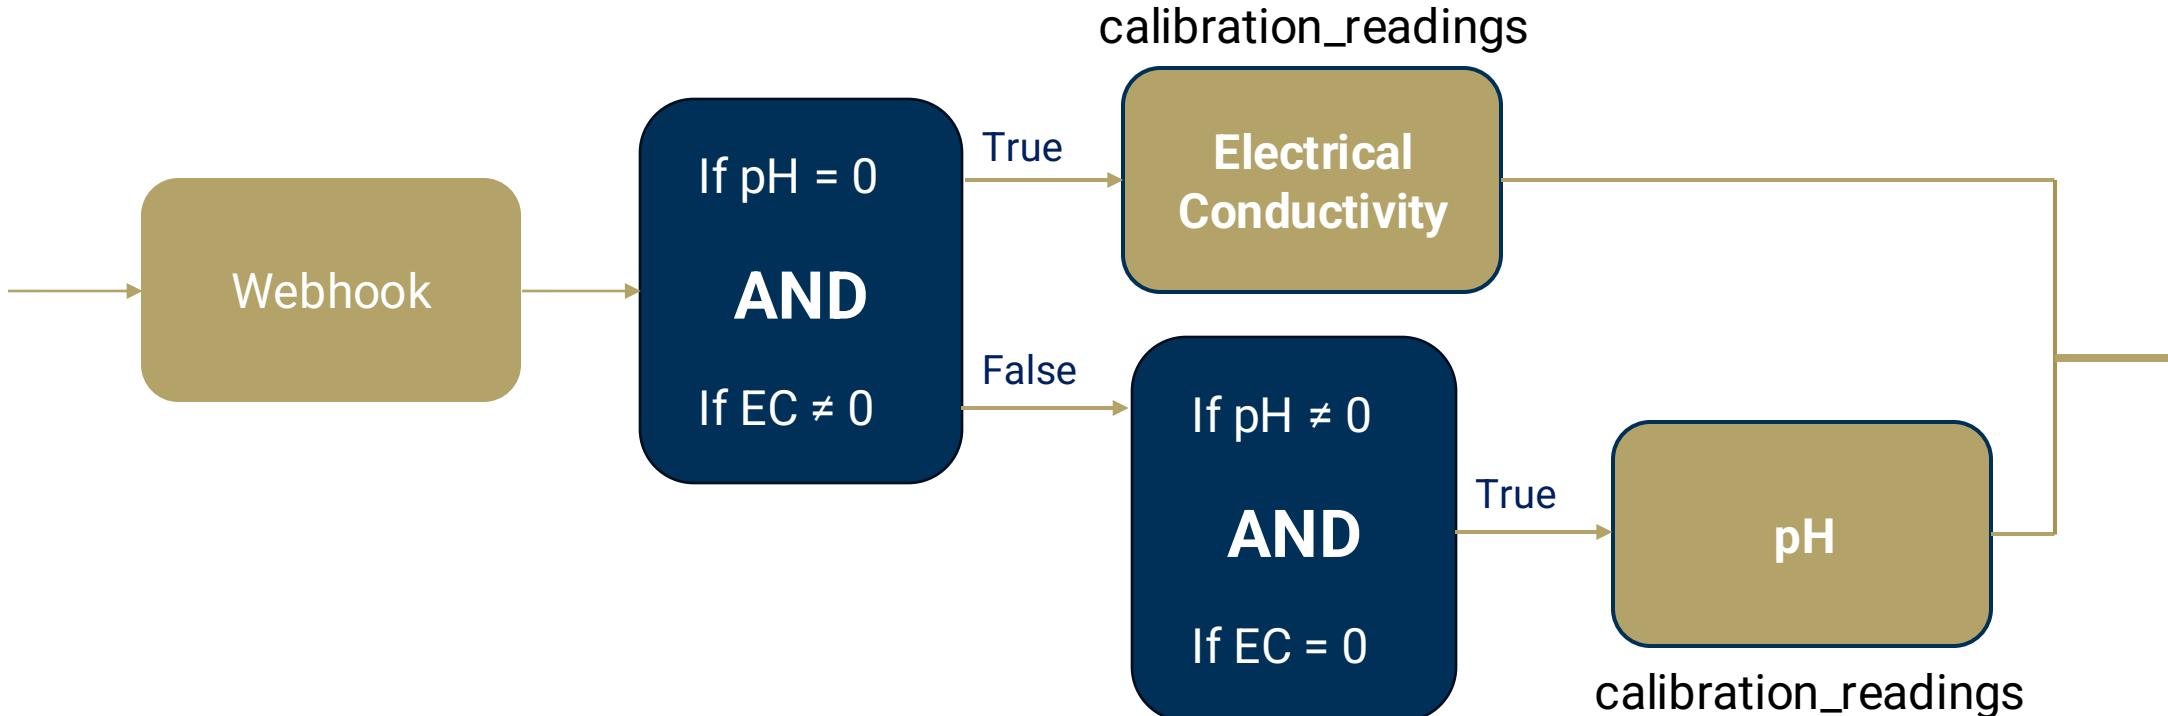

# Calibration - Lower Value

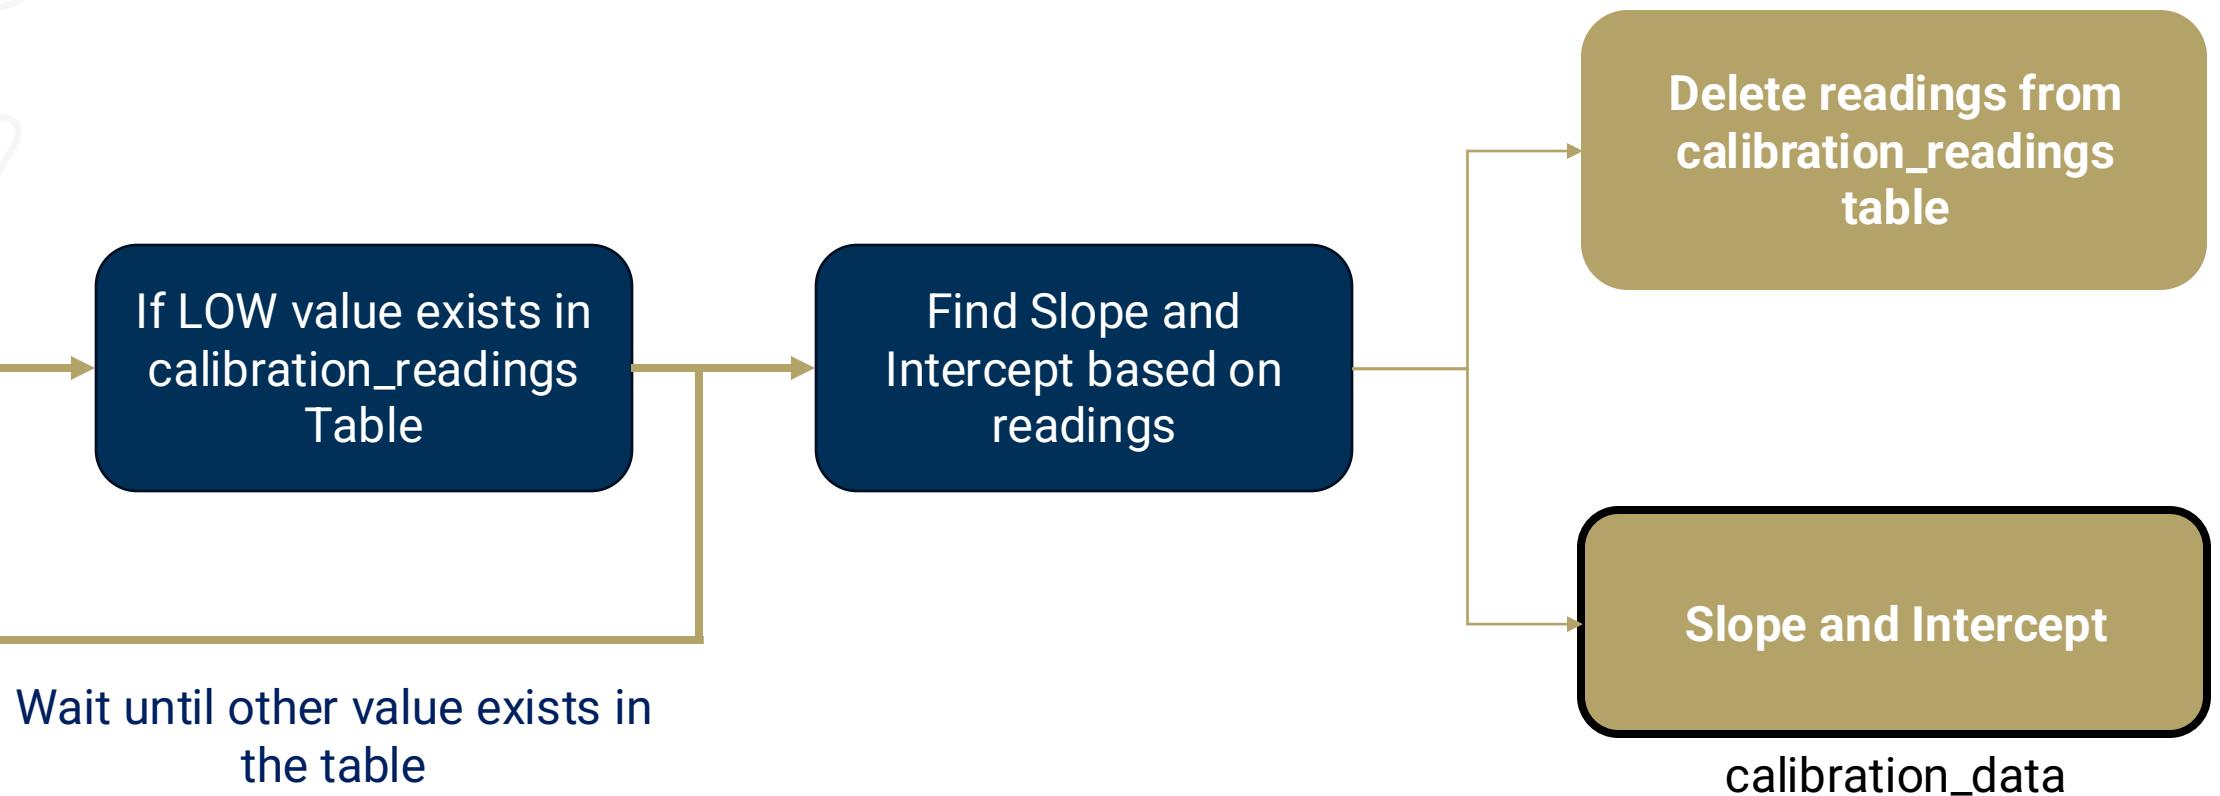

# Calibration - Higher Value

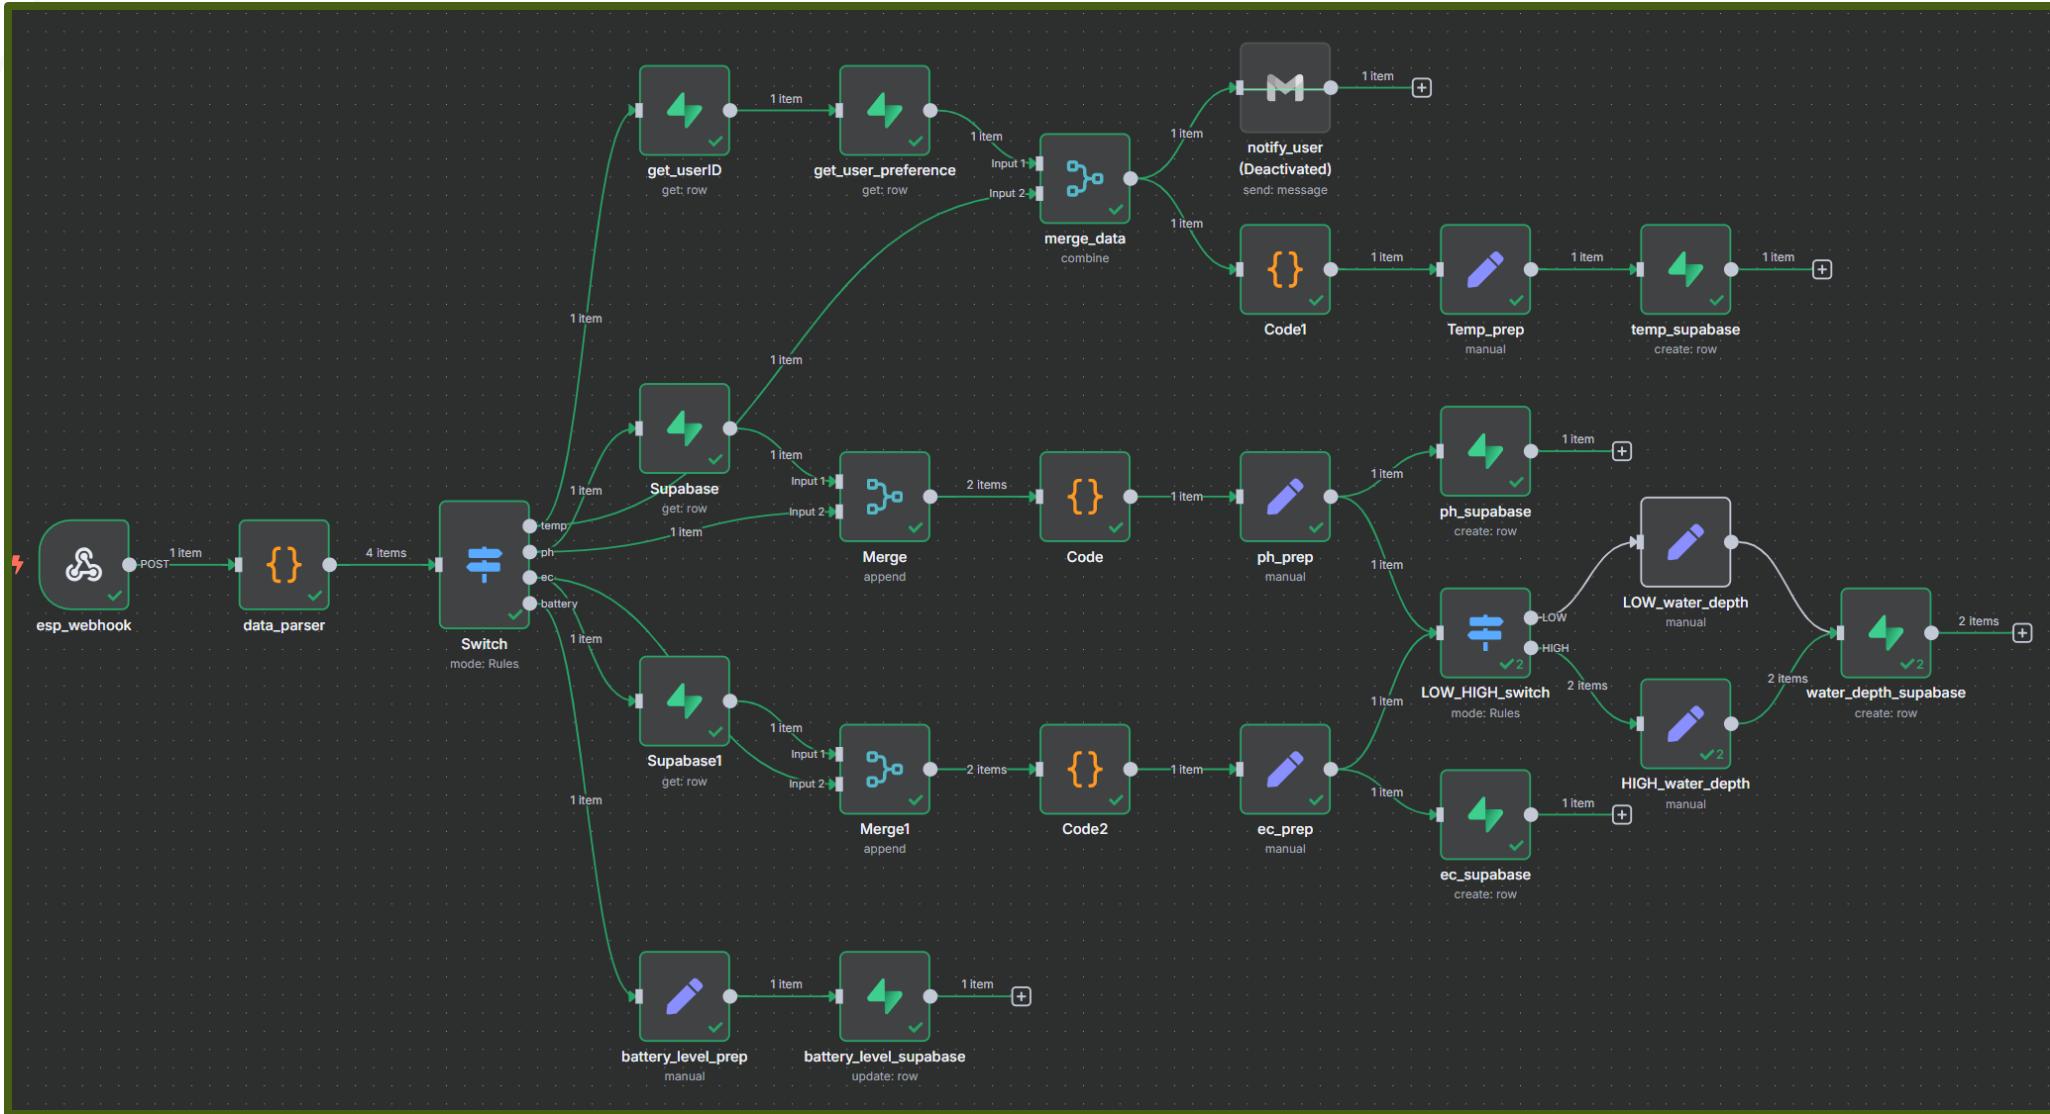

3x  
  
Press button  
three times on  
the device

# Calibration

# Calibration - Higher Value

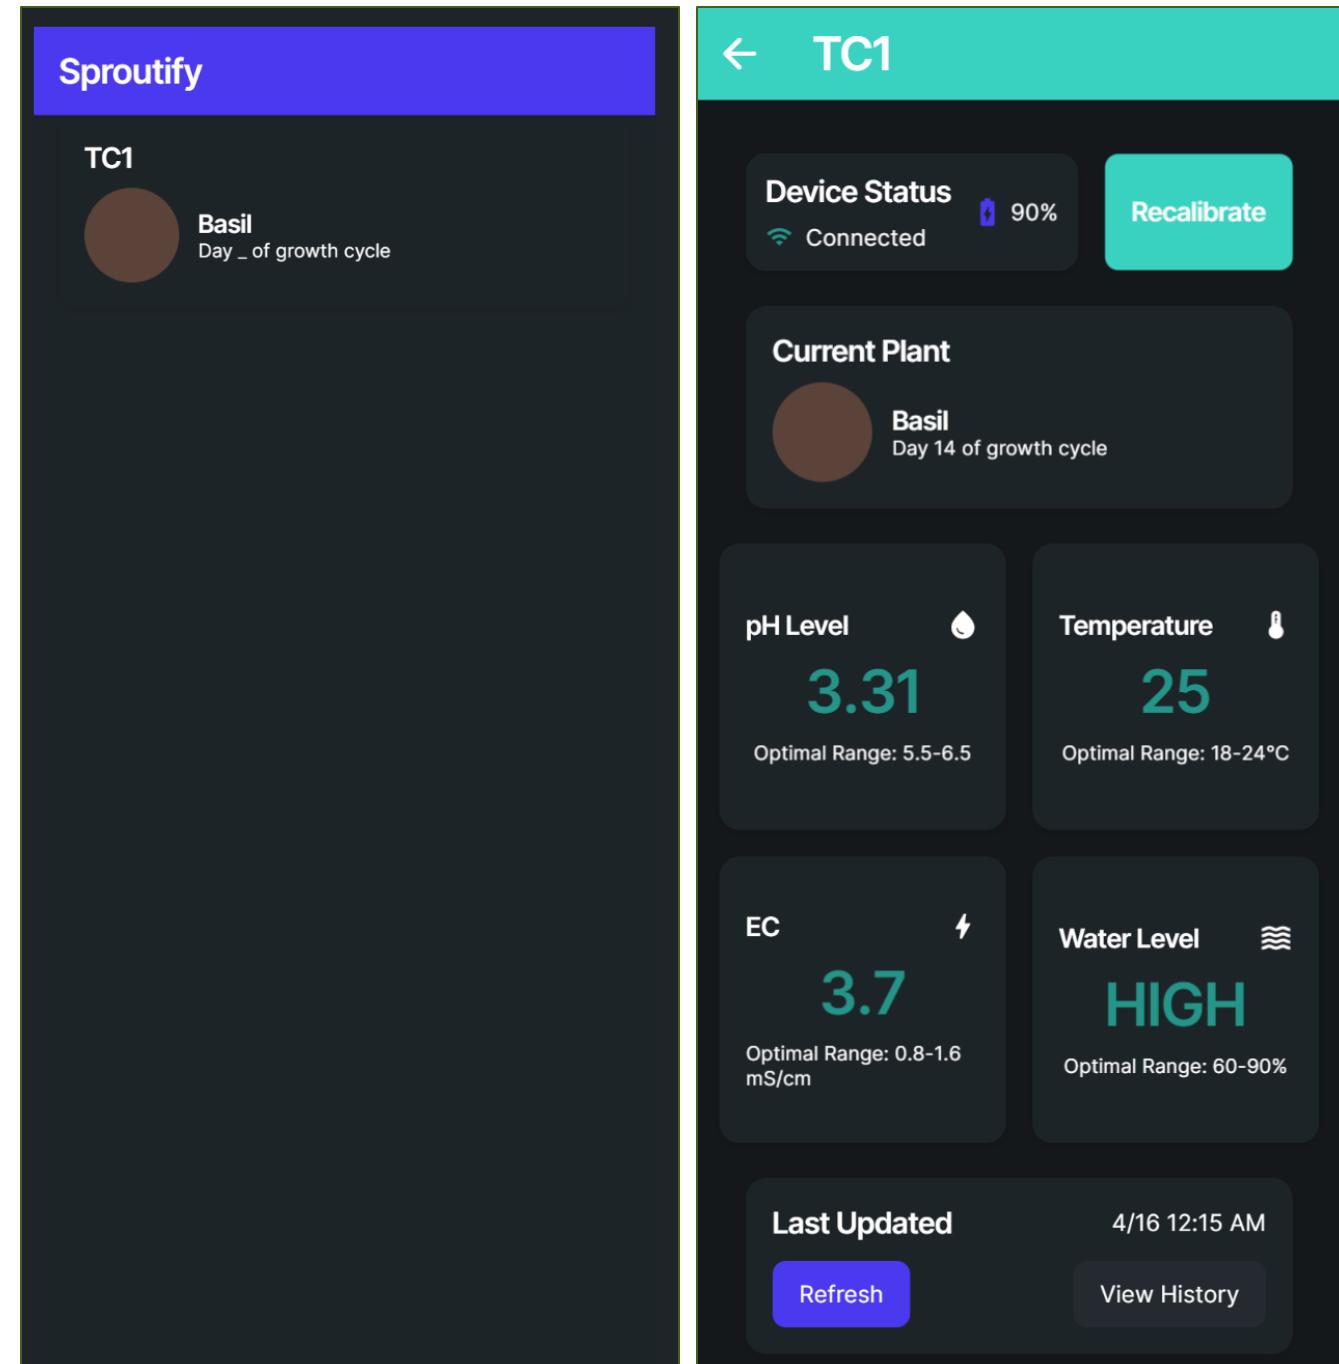

# Front End - FlutterFlow

**TowerCommander Details Page:**  
Device and Sensor Data  
displayed in user-friendly UI

**Recalibration button:**  
Walks user through calibration

# Front End - FlutterFlow

# N8N Webhook → Supabase → Frontend

The screenshot shows the Postman application interface. On the left, the sidebar includes 'My Workspace' (selected), 'Collections', 'Environments', 'Flows', and 'History'. The main workspace shows a 'New Collection' named 'New Collection' with a 'POST' request to 'http://localhost:5678/webhook-test/349f3a08-d34d-4904-9bb0-f0c2cab12c31/sensor-data'. The 'Body' tab is selected, showing a raw JSON payload:

```
1 {  
2   "mac_address": "AA:BB:CC:DD:EE:FF",  
3   "time_stamp": "2025-04-16T00:00:27-04:30",  
4   "sensors": {  
5     "temperature": 24,  
6     "ph": 7,  
7     "ec": 3,  
8     "battery": 0.85  
9   }  
10 }
```

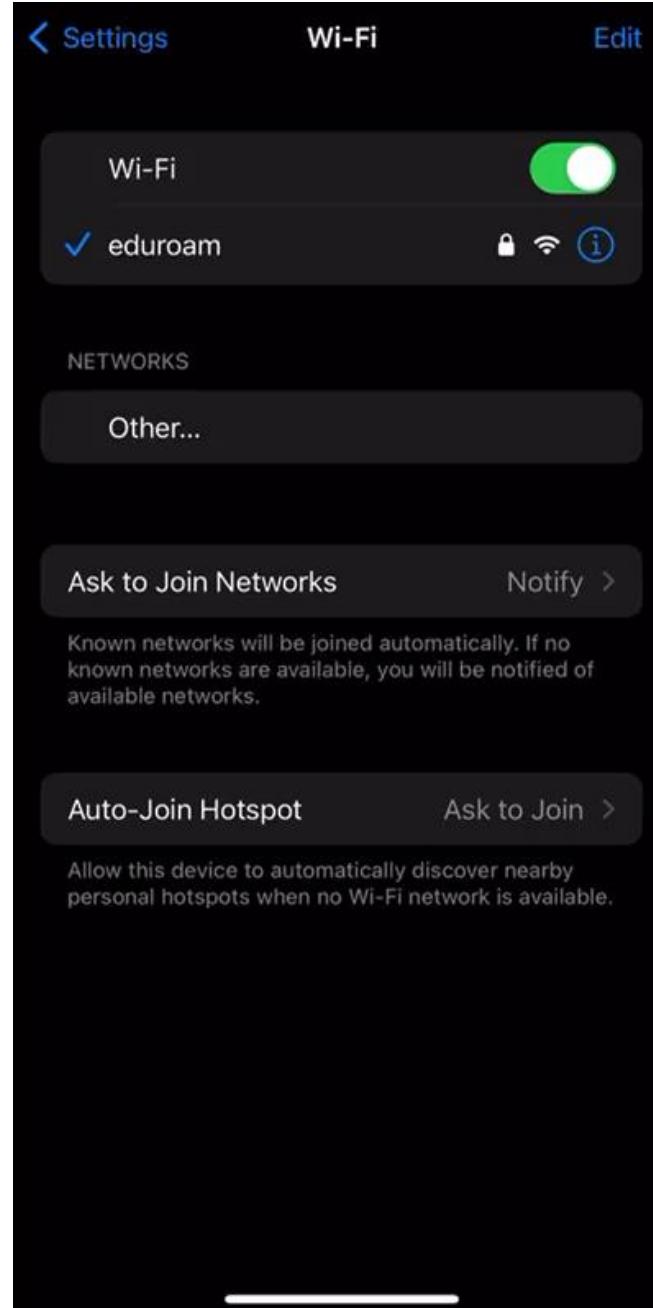

Below the body, the response section shows a '200 OK' status with a response time of 18 ms and a size of 269 B. The response body is:

```
1 {  
2   "message": "Workflow was started"  
3 }
```

At the bottom, the footer includes links for 'Postbot', 'Runner', 'Capture requests', 'Desktop Agent', 'Cookies', 'Vault', 'Trash', and help icons.

# Device Wi-fi Setup

1. The ESP generates a local Access Point (AP)
2. The user connects to the AP which prompts a wifi-portal
3. The user connects to their home wifi through this portal

# Driving Code & Data Send

1. Wakes up from deep sleep
2. Connects to configured WiFi
3. Takes sensor readings
4. Compiles data into JSON Payload
5. Sends to N8N
6. Goes to deep sleep\*

\*Would go to sleep for much longer

The screenshot shows the Arduino IDE interface with the following details:

- Project Title:** ESP32-WROOM-DA M...
- Code File:** \_driver-code.ino
- Line 385:** String timestamp = getTimestamp();
- WAKE BUTTON PIN:** Aa, ab, \* 3 of 3
- Serial Monitor Settings:** 115200 baud
- Message Input:** Message (Enter to send message to 'ESP32-WROOM-DA Module' on 'COM3')
- Serial Monitor Output:**
  - Going into deep sleep now...

  - \*wm:connectTimeout not set, ESP waitForConnectResult...
- Status Bar:** Ln 404, Col 25 ESP32-WROOM-DA Module on COM3

# Next Steps - Software

- Use Supabase filtering techniques to reduce number of tables for sensor readings
- Finalize recalibration method and display information in the application
- Rigorous testing to handle edge cases in n8n

# Next Steps

# Prototype → Product

- Cost

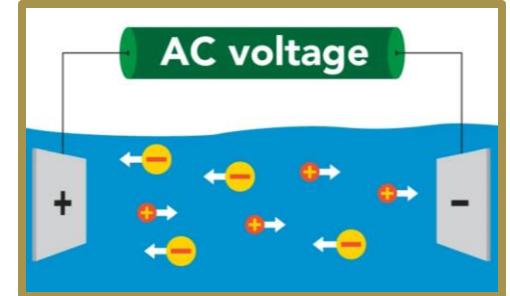

- Total Prototype Cost: ~\$180
- Sponsor's Desired Market Cost: \$99
  - ~\$70 with a minimum 40% retail markup

- Manufacturing

- Plastic-injection molded packaging
- PCB with integrated modules
- Gasket Lining & Custom Grommets

## How can this be achieved?

1. Mass production
2. Injection-molded Packaging
3. Sensor R&D

# Product Value

Scissortail Farms in Tulsa, OK utilizes 1200 Tower Gardens

1200 Tower Gardens  
x 5 minutes/tower/day  

---

100 labor-hours each day

36,500+ hours → \$700,000 in labor each year (approx.)  
At \$99/unit → \$120,000 Tower Commander Investment  
-\$50,000 Annual Overhead  

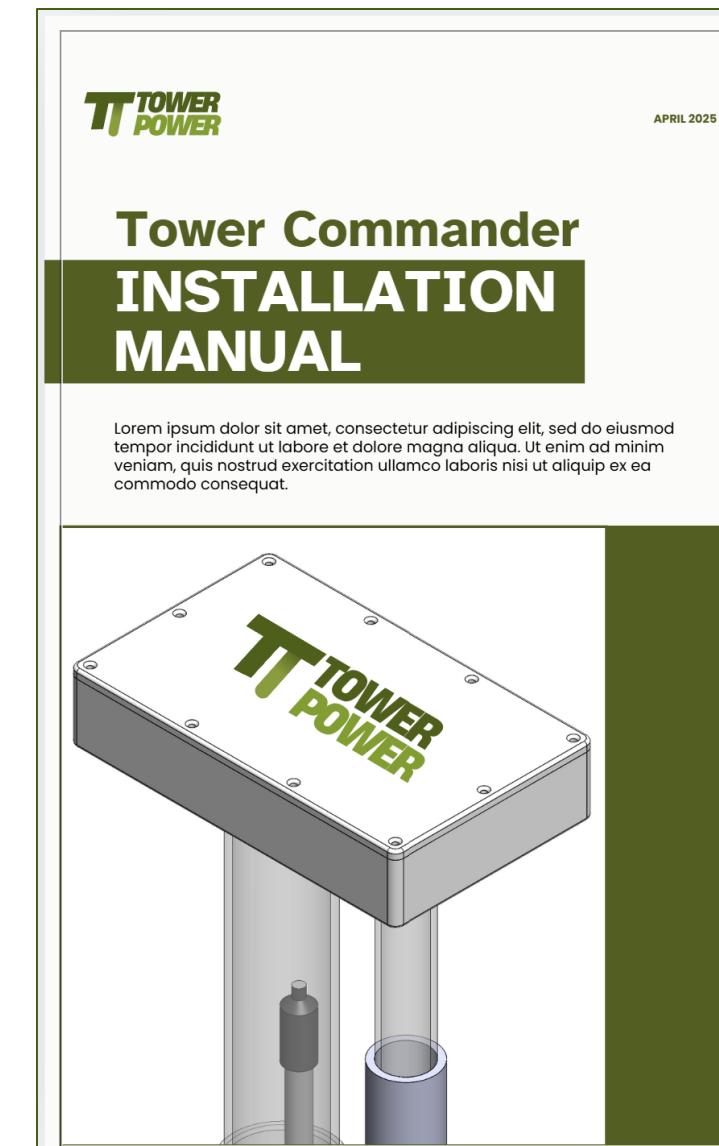

---

  
Year 1 → **\$530K SAVINGS**  
Year 2+ → **\$650K ANNUAL SAVINGS**

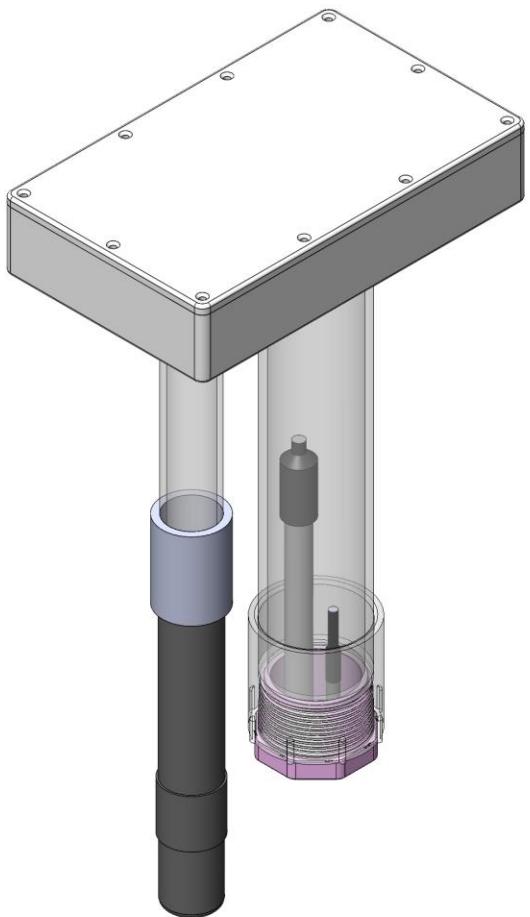

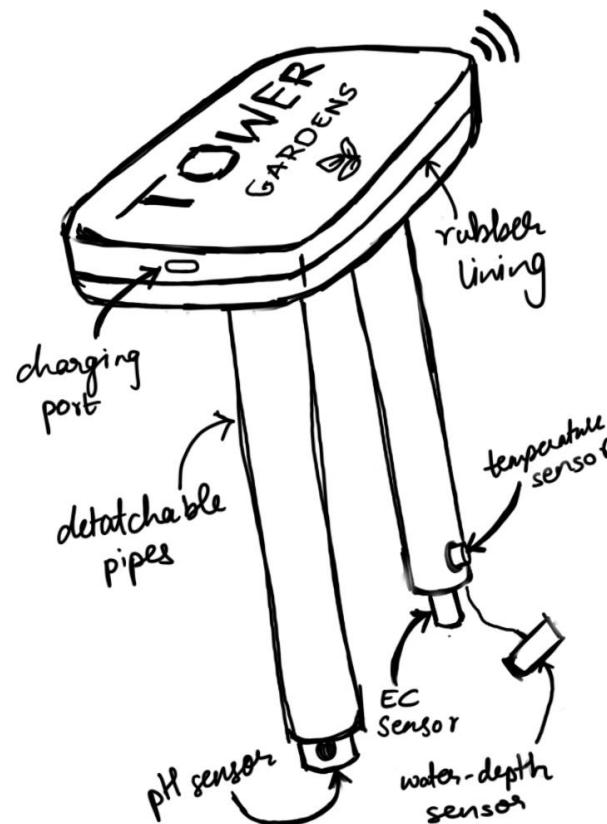

Represents \$500+ of value per Tower Garden each year

# Overall Next Steps

- Goal by Expo:
  - Completed and functioning sensor manipulation
  - Successfully printed and assembled packaging
  - Further comprehensive software (back-end)
  - Development of Device Usage Instruction Manual
- Current Issues:
  - pH sensor unsuccessful in reading
  - Integration of PCB into enclosure
  - Temp sensor connection – Not Waterproof

# Thank You! Questions?

# Approximate Battery Life

- **Active:** 3 sensors activate 4x per day (60s each)
  - Sensing & transmitting on WiFi → 150 mA
- **Sleep:** ESP32 WiFi-on modem sleep → 20 mA
- **Deep Sleep:** Disconnects from WiFi → 0.1 mA

For 1 Day:

$$\begin{aligned} & (150 \text{mA} * 0.2\text{hr}) + (20 \text{mA} * 3.0\text{hr}) + (0.1 \text{mA} * 20.8\text{hr}) \\ & = (30 + 60 + 2.08) \text{ mAh} = 92.08 \text{ mAh} \end{aligned}$$

3000 mAh battery life is ~32.5 days
